**29. Consider proposed Ordinance approving ZDC-130-2020**

**Action:**

*None*

**30. Public Hearing on a request by Jeri Thomas, Thomas & Burns, for a Replat of Lot 43, Ferris Second Addition, to create Lots 43A and 43B, Ferris Second Addition, 0.425 acres (Property ID 173386) – Owner: JERI A THOMAS (SUB-131-2020)**

Mayor Hill opened the Public Hearing.

Mr. Brooks reported the applicant is requesting a hardship waiver be granted by city council to allow for the establishment of Lot 43B and allow the proposed lot from Cow Alley without establishing direct access to Ferris Avenue. He reviewed staff concerns noting an access easement has not been provided, which would allow access to the proposed Lot 43B from Ferris Avenue.

(5a)

City Council  
November 16, 2020  
Page 8

He explained typically an access from the public ROW is needed and would be required for this lot. Staff recommended disapproval.

There being no others to speak for or against SUB-131-2020, Mayor Hill closed the Public Hearing.

**31. Consider approval of SUB-131-2020**

**Action:**

*Council Member Melissa Olson moved to approve a request by Jeri Thomas, Thomas & Burns, for a Replat of Lot 43, Ferris Second Addition, to create Lots 43A and 43B, Ferris Second Addition, 0.425 acres (Property ID 173386) – Owner: JERI A THOMAS (SUB-131-2020). Council Member Chuck Beatty seconded. The vote was as follows:*

*Ayes: David Hill  
Mary Lou Shipley  
Chuck Beatty  
Melissa Olson*

*Noes: Doug Barnes*

*The motion carried.*

**32. Public Hearing on a request by applicant Nutrenare-AG, Inc., owner of property located at 4740 N. Interstate 35E, Waxahachie, Texas for a tax abatement agreement in support of an expansion of business operations including, but not limited to, a new building with improvements estimated at \$5,100,000 and the establishment of Tax Reinvestment Zone #30 at 4740 N. Interstate 35, Waxahachie, Texas**

Mayor Hill opened the Public Hearing.

Mr. Warran Ketteman, Senior Economic Development Director, reported the expansion will add an additional 12 new employees and increase their local payroll by approximately \$1,200,000. On September 30, 2020 the Economic Development Commission met and unanimously approved a tax abatement for the improvements, both real and personal, at “50% abatement for 5 years”. Estimated total taxes received and abated by the City of Waxahachie over the five years are \$77,651 received and \$77,651 abated.

There being no others to speak for or against a request from Nutrenare-AG, Inc., Mayor Hill closed the Public Hearing.

**33. Consider proposed Ordinance designating a certain area within the taxing jurisdiction of the City of Waxahachie to be known as Reinvestment Zone #30; establishing the boundaries thereof; and providing for an effective date**

(5a)

**ORDINANCE NO. 3236**

**AN ORDINANCE DESIGNATING A CERTAIN AREA IN THE CITY OF WAXAHACHIE AS "TAX ABATEMENT REINVESTMENT ZONE #30, CITY OF WAXAHACHIE, TEXAS"; PROVIDING THE EFFECTIVE AND EXPIRATION DATES FOR THE ZONE AND A MECHANISM FOR RENEWAL OF THE ZONE; AND CONTAINING OTHER MATTERS RELATED TO THE ZONE.**

**Action:**

*Council Member Doug Barnes moved to approve Ordinance No. 3236. Mayor Pro Tem Mary Lou Shipley seconded. The vote was as follows:*

*Ayes: David Hill  
Mary Lou Shipley  
Chuck Beatty  
Doug Barnes*

*Noes: Melissa Olson*

*The motion carried.*

- 34. Consider proposed Resolution approving Tax Abatement Agreement for Nutrenare-AG, Inc. in support of expansion of business operations at 4740 N. Interstate 35, Waxahachie, Texas.

**RESOLUTION NO. 1297**

**A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF WAXAHACHIE, TEXAS, APPROVING THE TERMS AND CONDITIONS OF AN AGREEMENT BY AND BETWEEN THE CITY OF WAXAHACHIE, TEXAS AND NUTRENARE-AG; AND AUTHORIZING ITS EXECUTION BY THE CITY MANAGER, OR IN HIS ABSENCE THE ASSISTANT CITY MANAGER; AND PROVIDING AN EFFECTIVE DATE.**

**Action:**

*Council Member Chuck Beatty moved to approve Resolution No. 1297. Mayor Pro Tem Mary Lou Shipley seconded. The vote was as follows:*

*Ayes: David Hill  
Mary Lou Shipley  
Chuck Beatty  
Doug Barnes*

*Noes: Melissa Olson*

*The motion carried.*

(5a)

35. **Public Hearing on a request by applicant Timco Logistics Systems, Inc. and Myti Properties, LLC, owner of property located at 197 Ovilla Road, Waxahachie, Texas for a tax abatement agreement in support of an expansion of business operations including, but not limited to, a new building with improvements estimated at \$6,950,000 and the establishment of Tax Reinvestment Zone #31 at 197 Ovilla Road, Waxahachie, Texas**

Mayor Hill opened the Public Hearing.

Mr. Ketteaman reported Timco Logistics expansion will add an additional 15 employees and relocate another 18 employees and increase their local payroll by approximately \$2,780,000. On September 30, 2020 the Economic Development Commission met and unanimously approved a tax abatement for the real property improvements at "50% for 5 years". Estimated total taxes received and abated by the City of Waxahachie over the five years are: \$119,355 received, \$119,355 abated.

There being no others to speak for or against a request from Timco Logistics Systems, Inc., Mayor Hill closed the Public Hearing.

36. **Consider proposed Ordinance designating a certain area within the taxing jurisdiction of the City of Waxahachie to be known as Reinvestment Zone #31; establishing the boundaries thereof; and providing for an effective date**

**ORDINANCE NO. 3237**

**AN ORDINANCE DESIGNATING A CERTAIN AREA IN THE CITY OF WAXAHACHIE AS "TAX ABATEMENT REINVESTMENT ZONE #31, CITY OF WAXAHACHIE, TEXAS"; PROVIDING THE EFFECTIVE AND EXPIRATION DATES FOR THE ZONE AND A MECHANISM FOR RENEWAL OF THE ZONE; AND CONTAINING OTHER MATTERS RELATED TO THE ZONE.**

**Action:**

*Council Member Chuck Beatty moved to approve Ordinance No. 3237. Mayor Pro Tem Mary Lou Shipley seconded. The vote was as follows:*

*Ayes: David Hill  
Mary Lou Shipley  
Chuck Beatty  
Doug Barnes*

*Noes: Melissa Olson*

***The motion carried.***

40. **Consider proposed Resolution approving Tax Abatement Agreement for Kinro Texas, Inc. in support of expansion of business operations at 101 Mushroom Road, Waxahachie, Texas**

**RESOLUTION NO. 1299**

**A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF WAXAHACHIE, TEXAS, APPROVING THE TERMS AND CONDITIONS OF AN AGREEMENT BY AND BETWEEN THE CITY OF WAXAHACHIE, TEXAS AND KINRO TEXAS, INC.; AND AUTHORIZING ITS EXECUTION BY THE CITY MANAGER, OR IN HIS ABSENCE THE ASSISTANT CITY MANAGER; AND PROVIDING AN EFFECTIVE DATE.**

**Action:**

*Council Member Chuck Beatty moved to approve Resolution No. 1299. Mayor Pro Tem Mary Lou Shipley seconded, All Ayes.*

41. **Consider Interlocal Agreement with the Southern Regional Response Group/Special Response Team**

**Action:**

*Mayor Pro Tem Mary Lou Shipley moved to approve an Interlocal Agreement with the Southern Regional Response Group/Special Response Team. Council Member Melissa Olson seconded, All Ayes.*

42. **Consider Professional Services Agreements for Architectural Services and Project Management Services for the City Hall Annex project**

Mr. Scott reviewed the services for the City Hall Annex project noting the Professional Services Agreements for Architectural Services and Project Management Services is budgeted in the 2020-2021 budget. He requested authorization for City Manager to engage Architexas for phase II architectural services in the amount of \$1,215,000 and the Vidaurri Management Group for project management services in the amount of \$390,000 for the City Hall Annex project. Both not to exceed the budgeted amount of \$1,686,645. The budgeted amount also provides for printing, contingency, as well as other miscellaneous expenses that may be incurred.

**Action:**

*Council Member Chuck Beatty moved to approve Professional Services Agreements for Architectural Services and Project Management Services for the City Hall Annex project. Mayor Pro Tem Mary Lou Shipley seconded, All Ayes.*

(5a)

**43. Comments by Mayor, City Council, City Attorney and City Manager**

Assistant City Managers Albert Lawrence and Tommy Ludwig welcomed Council Member Doug Barnes noting his heart is in the best interest of Waxahachie and he will do a great job.

Council Member Doug Barnes stated he intends to continue to provide quality of life for the citizens. He commended the three industries approved in the community noting they are truly an asset to our community. He stated we have a balanced community and it is a great place to live and work.

Council Member Chuck Beatty welcomed Mr. Barnes and noted he is looking forward to the downtown project.

City Manager Michael Scott thanked City Council for their support on the agenda items tonight. He congratulated Council Member Doug Barnes as the new member of City Council and congratulated Mayor David Hill and Mayor Pro Tem Mary Lou Shipley on their re-appointment as Mayor and Mayor Pro Tem.

Mayor Pro Tem Mary Lou Shipley congratulated Mr. Barnes noting she has always found him very knowledgeable and he has the interest of the citizens at heart. She stated she is excited about the City Hall Annex noting it will be a beautiful addition to downtown and improve working conditions for the employees.

Council Member Melissa Olson, City Attorney Robert Brown and City Secretary Lori Cartwright congratulated Mr. Barnes.

Ms. Amy Borders, Director of Communications and Marketing, congratulated Mr. Barnes and announced Good Morning Texas will air Tuesday morning promoting Waxahachie.

Mayor David Hill noted several good projects are going on around the city. He asked everyone to continue to be cautious of the Covid-19 virus as the numbers are increasing.

**44. Adjourn**

There being no further business, the meeting adjourned at 7:46 p.m.

Respectfully submitted,

Lori Cartwright  
City Secretary

City Council  
November 16, 2020

A briefing session of the Mayor and City Council of the City of Waxahachie, Texas was held in the City Council Conference Room at City Hall, 401 S. Rogers, Waxahachie, Texas, on Monday, November 16, 2020 at 6:00 p.m.

Council Members Present: David Hill, Mayor, Council Member Place 1  
Mary Lou Shipley, Mayor Pro Tem  
Chuck Beatty, Councilmember  
Melissa Olson, Council Member Place 3

Others Present: Michael Scott, City Manager  
Albert Lawrence, Assistant City Manager  
Tommy Ludwig, Assistant City Manager  
Robert Brown, City Attorney  
Lori Cartwright, City Secretary

**1. Call to Order**

Mayor David Hill called the meeting to order.

**2. Conduct a briefing to discuss items for the 7:00 p.m. regular meeting**

City Manager Michael Scott reviewed the city council agenda and explained the Ordinance cancelling the runoff election. He stated City Council will organize at this meeting.

Staff reviewed the following Consent Agenda Items:

- d. Interlocal Agreement with Ellis County for maintenance of roads, bridges, waterways and ditches – Mr. Scott stated this is a yearly agreement with Ellis County.
- e. Consider Waxahachie Community Development Corporation Expenditure and Award of Bid to Sports Fields, Inc. for Waxahachie Sports Complex Synthetic Turf Improvements – Assistant Director Sports Complex James Villarreal reported the improvements will be on three (3) fields and the bid is for two alternatives for \$483,960 plus up to a 10% contingency to account for unforeseen costs.
- f. Authorize Agreement with TimeClock Plus for new Time Clock System – Finance Director Chad Tustison reported the system automates the time process and keeps it in one system for more efficient tracking.

Director of Planning Shon Brooks reviewed the following cases:

- ANX-DNX-145-2020 – The applicant requested to continue ANX-DNX-145-2020 to the City Council meeting of December 21, 2020.
- ZDC-72-2020 – The applicant requested to continue ZDC-72-2020 to the City Council meeting of December 21, 2020.

(5b)

- ZDC-140-2020 – The applicant is requesting approval to allow an existing Family Home (child daycare at a single-family residence) use.
- ZDC-142-2020 – The applicant is requesting approval for a Specific Use Permit to allow the operation of a Private Country Club use with the sale of alcohol.
- ZDC-135-2020 – The applicant is requesting approval to allow a convenience store within an existing retail building.
- ZDC-137-2020 – The applicant is requesting approval to allow an Auto Parts and Accessory Sales store on one (1) acre.
- ZDC-147-2020 – The applicant is requesting to construct an accessory structure in the rear of a single-family zoned property. Mr. Brooks presented a rendering of the proposed structure noting staff has concerns with the roof pitch. He stated the applicant will be in attendance at the city council meeting to discuss the purpose of the roof pitch.
- SUB-130-2020 – The applicant withdrew.
- SUB-131-2020 – The applicant is requesting a replat to divide Lot 43, Ferris Second Addition into Lot 43A and 43B with Lot 43A fronting Ferris Avenue and Lot 43B consisting of the shop in the backyard. The applicant is also requesting that a petition of hardship waiver be granted to allow for the establishment of Lot 43B and allow the proposed lot from Cow Alley without establishing direct access to Ferris Avenue.

Assistant City Manager Albert Lawrence explained the required procedures for Tax Abatements noting Abatements have Public Hearings for the reinvestment zone, adopted by an Ordinance and the Tax Abatement is adopted by Resolution. He reported the following have gone through all the required steps for consideration and the Economic Development Corporation recommended approval.

Senior Economic Development Director Warren Kettelman reviewed the following:

- A request by applicant Nutrenare-AG, Inc., owner of property located at 4740 N. Interstate 35E, Waxahachie, Texas for a tax abatement agreement in support of an expansion of business operations including, but not limited to, a new building with improvements estimated at \$5,100,000 and the establishment of Tax Reinvestment Zone #30 at 4740 N. Interstate 35, Waxahachie, Texas
- A request by applicant Timco Logistics Systems, Inc. and Myti Properties, LLC, owner of property located at 197 Ovilla Road, Waxahachie, Texas for a tax abatement agreement in support of an expansion of business operations including, but not limited to, a new building with improvements estimated at \$6,950,000 and the establishment of Tax Reinvestment Zone #31 at 197 Ovilla Road, Waxahachie, Texas

(50)

- A request by applicant Kinro Texas, Inc., owner of property located at 101 Mushroom Road, Waxahachie, Texas for a tax abatement agreement in support of an expansion of business operations including, but not limited to, a new building with improvements estimated at \$18,000,000 and the establishment of Tax Reinvestment Zone #32 at 101 Mushroom Road, Waxahachie, Texas

Police Chief Wade Goolsby reported a Professional Services Agreement with the Southern Regional Response Group/Special Response Team allows the Waxahachie Police Department to be part of a multi-agency tactical team providing services to surrounding cities. He stated joining the team enhances the police department to respond to critical situations with a fully staffed and functional tactical team.

City Manager Michael Scott reported last year, Council authorized funds for phase I architectural services for the conversion of 406 and 410 S. Rogers into a City Hall Annex to house the Development Services departments. The Architexas professional services agreement will provide for the development of construction documents to be bid while the Vidaurri Management Group agreement will provide for oversight in project organization, planning, schedule management, design, bidding and negotiation, and construction and closeout. He reviewed the Fiscal Impact: \$1,686,645 has been allocated within the FY20-21 budget for both professional services agreements.

### **3. Adjourn**

There being no further business, the meeting adjourned at 6:46 p.m.

Respectfully submitted,

Lori Cartwright  
City Secretary

Re: Change Order #3 – 2020 Asphalt Street Rehabilitation

---

On Monday December 07, 2020, a change order will appear before the City Council for the 2020 Asphalt Street Rehabilitation project in the amount of \$86,612.00.

Reynolds Asphalt began work on the current street rehabilitation project in October which includes rehabilitation of 8 streets. This change order will add pavement rehabilitation of two additional locations to the contract, the 300 block of Boze Street and the 1700 block of E. Highland Road. Change Orders #1 provided for the removal and replacement of existing curb and gutter sections on Indian Trace Lane, Kiowa Lane and Buffalo Creek Drive that did not drain properly. Change order #2 provided for the removal of concrete found in the subgrade on McKenzie Street.

The original contract amount was \$543,313.00. City Council authorized funding for the original contract amount plus an additional \$30,000 project contingency from the Public Works Department 2020 street rehabilitation program operations budget. Change orders #1 and #2 increased the contract amount \$36,330.00 and \$2,835.00 respectively. These two change orders were processed administratively with funding available from the 2020 street rehabilitation program operations budget. Change order #3, in the amount of \$86,612.00, will increase the total contact amount to \$669,090.00. Funding for this additional scope of work will utilize the remaining \$18,252.00 from the 2020 street rehabilitation program in the operations budget. The additional funding of \$64,360.00 is available through the Capital budget.

I am available at your convenience should you need any additional information.

Tommy Ludwig

From: Wade G. Goolsby, Chief of Police  
Thru: Michael Scott, City Manager   
Date: November 30, 2020  
Re: Budget Adjustment

---

The purpose of this memo is to request a budget amendment that will allow the police department to recuperate procured insurance reimbursement funds used to repair a police vehicle. One of our police Patrol units was damaged while being used to perform law enforcement duties. We paid for the repairs out of our vehicle maintenance account, but the budget for the entire year is \$17,000.00 and the repair of this vehicle was approximately \$15,208.00. The purpose of this memo is to request the replacement of the funds spent out of the vehicle maintenance account for these repairs with the insurance reimbursements that were deposited in the Miscellaneous Revenue Insurance Reimbursement Revenue Account.

The City has already received insurance reimbursement funds from TML and they were posted to the Miscellaneous Revenue Insurance Reimbursement Revenue Account (100-49653). The City received a total of \$15,207.59 to repair the unit.

(5f)

I am requesting that the \$15,208.00 be transferred to Account 100-210-54340 Maintenance, Purchased – Vehicle, resulting in a budget increase of the same amount. The funds will help offset the expense and ensure that funds are available for the remainder of the budget year.

Date: December 2, 2020  
Re: Fiscal Year 2020 4<sup>th</sup> Quarter Financial Report

---

I am pleased to present the 4<sup>th</sup> Quarter Financial Report for fiscal year 2020, covering the period of October 2019 through September 2020. This report highlights the General Fund, Water and Wastewater funds, Waxahachie Community Development Corporation (WCDC) Fund, Hotel/Motel Fund and the Tax Increment Refinance Zone (TIRZ) Fund. This report compares actual revenue collections and expenses incurred during the year to the approved budget.

Although we do not anticipate any major changes in these figures, please note that this report is preliminary and may change as we go through the year-end close-out process and annual audit. The audit is anticipated to be completed and presented to the City Council in March 2021. Overall, the City's financial position is positive for all funds, especially considering the unprecedented impacts of COVID-19 on national and local economies.

### **General Fund**

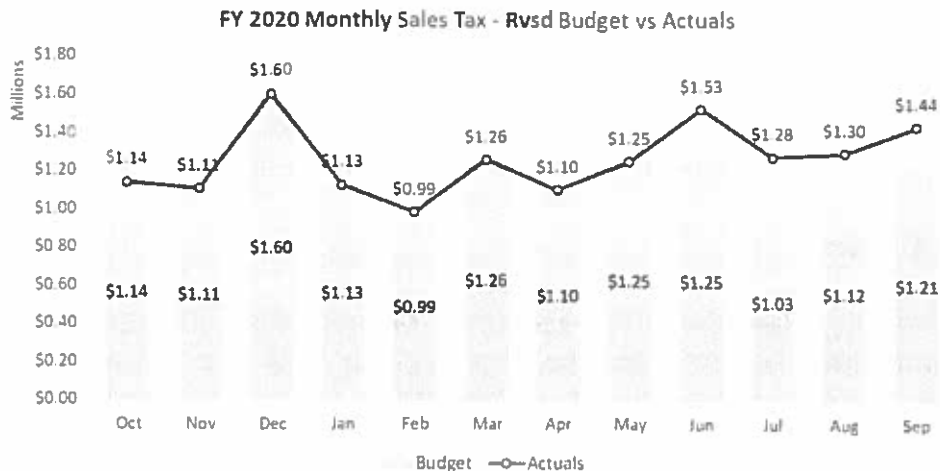

- The City's General Fund accounts for activities commonly associated with municipal government such as police and fire protection, parks and recreation, routine street maintenance, and library services. This fund is

(5a)

supported by property tax, sales tax, user fees, permits and other miscellaneous revenues. Overall, revenues have performed better than anticipated and expenses are within budget.

- **Revenues** for the fourth quarter (12 months) total \$45.2 million. This is an increase of \$2.9 million, or 6.8%, over the same period last year. Total revenue collected at the end September 2020 comes in over the revised budget by \$1.0 million, or 2.3%.
- Property tax collections account for approximately 40% of the City's revenue. The majority of collections occur earlier in the fiscal year between December and February as property tax payments become due. Through the 4<sup>th</sup> quarter, property taxes in the City's General Fund amount to \$18.0M and are in line with budget projections.
- Sales tax is the second largest revenue source, accounting for over 30% of the City's General Fund. Of the 8.25 cents for every dollar of taxable sales, the state of Texas collects 6.25 cents, while 1.5 cents goes to the City's General Fund, and ½ cent goes to the WCDC fund.

This year proved particularly challenging in gauging the potential negative impact of COVID-19 on City finances, specifically for sales tax. The unprecedented conditions brought about a high level of uncertainty. In March, April, and May we saw some leveling out of sales tax collections as a result of the decline in economic activity. As we went into the summer budget season, we revised the budget down by 1% to account for potential sales tax decline for the remaining four months of the fiscal year. Since that time, we have seen much stronger sales tax growth than anticipated. The following chart shows the actual sales tax collections by month compared to the revised budget.

Through the 4th quarter, collections in the General Fund total \$15.1 million and represent an increase of 9% over the prior year. Compared to the revised budget, sales tax collections are up \$950,000, or 7%. While we will close the year with better than anticipated sales tax revenue, it's important to note that the duration and depth of any impact is still playing out locally and nationally and may impact us in the future.

- Other major revenue sources include Franchise Fees, Licenses and Permits, Charges for Service, Miscellaneous revenue and Transfers In. Franchise fees are slightly below budget. In the areas of licenses and charges for service, we saw increased building permits and inspection fees above the revised budget, although there is some drop off from the prior year.
- **Expenditures** in the General Fund for the fourth quarter (12 months) total \$42.3 million and are in line with the FY 2020 Revised Budget. The following chart compares the budget for each City function to the actual expenditures through the 4<sup>th</sup> quarter.

- In the area of Culture and Recreation, the City realized savings in utilities and other operating expenses related to the temporary closing of the Senior Center, Optimist Pool, and other City facilities as a result of COVID-19.
- In the area of Public Works, there is a savings of approximately \$2.2 million in annual street maintenance and improvements. However, as part of the year-end close-out process, this savings will be transferred

out of the General Fund budget to the Streets Capital Projects Fund. That transfer of savings to the project fund is reflected in the Public Works category.

### **Other Funds**

- The water and wastewater funds account for all revenues and expenditures associated with the operation and maintenance of the City's water distribution and wastewater treatment activities. For the water and wastewater funds, revenue is slightly higher than anticipated for residential water collections. Expenses are slightly lower than budget for both funds.
- The WCDC fund accounts for revenues and expenses associated with the Waxahachie Community Development Corporation in operating the Civic Center and Sports Complex, promoting economic development, and implementing quality of life improvements throughout the community. This fund is mainly funded by ½ cent sales tax and user fees. Similar to the General Fund, sales tax are up nearly 7%, or \$317K, over the revised budget. User fees for the Civic Center and Sports Complex came in at roughly half of last year's revenue, mainly attributable to cancellations and slow-down due to COVID-19. Expenses for the fund came in about 4% under budget.
- The Hotel/Motel Tax Fund receives the proceeds from a 7% hotel occupancy tax available to be used to promote tourism and the convention and hotel industry. The City uses the fund to operate the Convention and Visitor's Bureau and various smaller non-city organizations that promote the arts and historic tourism and preservation. Hotel revenue is down slightly from the revised budget and down over 30% from last year as a result of COVID-19. In response to the decline, the City reduced expenditures for advertising and marketing, and reduced the budget for the arts organization, proportional to the anticipated reduction in hotel revenue.

## CITY OF WAXAHACHIE QUARTERLY FINANCIAL REPORT

FISCAL YEAR 2020 ~ 4TH QUARTER

(Oct 1, 2019-Sept 30, 2020)

### GENERAL FUND SUMMARY

	4TH QUARTER FY 2019	BUDGET FY 2020	4TH QUARTER FY 2020	ACTUAL AS % OF BUDGET
<b>REVENUES</b>				
Property Tax	\$15,873,398	\$17,999,700	\$18,013,575	100%
Sales Tax	13,885,907	14,190,000	15,141,348	107%

Re: 2020 Impact Fee Update

---

On Monday December 7, 2020 an ordinance 1) updating the City's land use assumptions; 2) updating the water, wastewater, and roadway capital improvement plans; 3) establishing the maximum assessment rate for water, wastewater, and roadway impact fees; and 4) establishing the collection rate for water, wastewater, and roadway impact fees will appear before City Council for consideration.

As a reminder, the statutory impact fee update was initiated by staff in November 2019. Since that time, staff and the City's consultants met with the Impact Fee Capital Improvement Advisory Committee (IFCIAC) regarding updated land use assumptions, capital improvement plans, and/or the associated impact fee calculations a total of four times. The IFCIAC ultimately voted unanimously to recommend the City Council approve staff's recommendations associated with the overall impact fee update, with their formal recommendation letter appearing before City Council on November 2, 2020.

For your reference, below is the recommended collection rate for the impact fee program:

(6+7)

Service Area	Recommended Credited Collection Rate (per service unit)
1	\$925.00
2	\$1,014.00
3	\$1,102.00
4	\$1,193.00
5	\$1,144.00
6	\$923.00
7	\$1,420.00
WATER	Recommended Credited Collection Rate (per service unit)
	\$2,216.00
WASTEWATER	Recommended Credited Collection Rate (per service unit)
	\$2,321.00

I am available at your convenience should you need additional information.

Tommy Ludwig

**CITY OF WAXAHACHIE, TEXAS**

**ORDINANCE NO. \_\_\_\_\_**

**AN ORDINANCE OF THE CITY OF WAXAHACHIE, TEXAS, ADOPTING UPDATED LAND USE ASSUMPTIONS, CAPITAL IMPROVEMENTS PLANS AND ASSOCIATED BOUNDARIES; AND APPROVING REVISED ASSESSMENT AND COLLECTION SCHEDULES FOR WATER, WASTEWATER, AND ROADWAY IMPACT FEES; PROVIDING FOR SEVERABILITY; PROVIDING FOR CONFLICTS; AND PROVIDING AN EFFECTIVE DATE.**

**WHEREAS**, Chapter 395, Tex. Loc. Gov't Code, provides procedures for adopting and updating land use assumptions, capital improvements plans, and impact fees; and

**WHEREAS**, the City Council for the City of Waxahachie, Texas, adopted land use assumptions, capital improvements plans and impact fees for water and wastewater facilities in accordance with statutory procedures and established provisions for administering its impact fee program through Ordinance No. 2092, adopted August 20, 2001; and

**WHEREAS**, the City Council for the City of Waxahachie, Texas, adopted land use assumptions, a capital improvement plan and impact fees for roadway facilities in accordance with statutory procedures and established provisions for administering its impact fee program through Ordinance No. 2494, adopted November 17, 2008; and

**WHEREAS**, the City Council last approved updated land use assumptions and capital improvements plans for water and wastewater facilities by Ordinance No. 2830, adopted November 2, 2015; and

**WHEREAS**, the City last updated its Water and Wastewater Schedule 1 and 2 rates for collecting impact fees by Ordinance No. 2830, adopted November 2, 2015; and

**WHEREAS**, the City Council last approved updated land use assumptions and capital improvements plans for roadway facilities by Ordinance No. 2830, adopted November 2, 2015; and

**WHEREAS**, the City last updated its Roadway Schedule 1 and 2 rates for collecting impact fees by Ordinance No. 2830, adopted November 2, 2015; and

**WHEREAS**, the City of Waxahachie has appointed an Impact Fee Capital Improvements Advisory Committee to advise the City Council concerning amendments to and adoption of the land use assumptions, impact fee capital improvements plans, and impact fees for water, wastewater, and roadway facilities; and

**WHEREAS**, the City has retained consultants to prepare and/or update land use assumptions, capital improvements plans, and impact fees for water, wastewater, and roadway facilities; and

**WHEREAS**, the capital improvements plans and impact fees for water, wastewater, and roadway facilities were prepared by a qualified professional engineer; and

**WHEREAS**, notice has been published, public hearing held, and the written recommendations of the Impact Fee Capital Improvements Advisory Committee received concerning revised land use assumptions, impact fee capital improvements plans, and the assessment of impact fees for water, wastewater, and roadway facilities; and

**WHEREAS**, the City Council finds that it is in the best interest of the citizens of the City to adopt updated land use assumptions, capital improvements plans, and impact fees for water, wastewater and roadway facilities; and

**WHEREAS**, the City Council finds that in all things the City has complied with Chapter 395 of the Texas Local Government Code in the notice, adoption, promulgation, and methodology necessary to adopt impact fees; and

**WHEREAS**, this ordinance is intended to and satisfies the statutory requirements for adoption of land use assumptions, capital improvements plans and impact fees; and

**NOW, THEREFORE, BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF WAXAHACHIE, TEXAS THAT:**

**Section 1. Land Use Assumptions.** The land use assumptions for the City of Waxahachie hereby are updated for water, wastewater, and roadway facilities, as provided in Exhibit A of this amendatory ordinance, which is attached hereto and incorporated herein by reference as if fully set forth.

**Section 2. Capital Improvements Plans.** The water, wastewater, and roadway capital improvements plans, and associated service area maps and land use equivalency tables, are hereby updated, as provided in Exhibit B for water and wastewater and Exhibit C for roadway, which are attached hereto and incorporated herein by reference as if fully set forth.

**Section 3. Schedule One.** Schedule 1 for water, wastewater, and roadway facilities is hereby updated, setting forth the maximum assessment rate per service unit to be assessed against new development for water, wastewater and roadway facilities, which schedule is attached hereto as Exhibit D, and is incorporated herein by reference as if fully set forth.

**Section 4. Schedule Two.** Schedule 2 for water, wastewater, and roadway facilities is hereby updated, setting forth the maximum collection rate per service unit to be charged against new development for water, wastewater, and roadway facilities, which schedule is attached hereto as Exhibit E, and is incorporated herein by reference as if fully set forth. City Council may increase or decrease the maximum collection rate for water, wastewater, and roadway facilities, but in no

event may the maximum collection rate be set higher than the maximum assessment rate for water, wastewater, and roadway facilities.

**Section 5. Provisions Cumulative; Conflicts.** This ordinance shall be and is hereby declared to be cumulative of all other ordinances of the City of Waxahachie, and this ordinance shall not operate to repeal or affect any of such other ordinances except insofar as the provisions thereof might be inconsistent or in conflict with the provisions of this ordinance, in which event such conflicting provisions, if any in such other ordinance or ordinances are hereby superseded.

**Section 6. Severability.** If any section, subsection, sentence, clause or phrase of this ordinance is for any reason held to be unconstitutional, such holding shall not affect the validity of any other section, sentence, clause or phrase of this ordinance the remaining portions of this ordinance.

**Section 7. Effective Date.** This ordinance shall become effective thirty (30) days after approval.

**CITY OF WAXAHACHIE, TEXAS:**

**EXECUTED** by the City of Waxahachie on this the 7th day of December, 2020.

# 1. PURPOSE

Chapter 395 of the Texas Local Government Code prescribes the process by which cities in Texas must formulate development impact fees. The initial process is the establishment of land use assumptions. These land use assumptions, which also include population and employment projections, will become the basis for the preparation of impact fee capital improvement plans for water, wastewater, and roadway facilities.

To assist the City of Waxahachie in determining the need and timing of capital improvements to serve future development, a reasonable estimation of future growth is required. The purpose of this report is to formulate growth and development projections based upon assumptions pertaining to the type, location, quantity and timing of various future land uses within the community, and to establish and document the methodology used for preparing the growth and land use assumptions.

## Land Use Assumptions Report Elements

This report contains the following components:

- I. **Methodology** – Explanation of the general methodology used to prepare the land use assumptions.
- II. **Data Collection Zones & Service Area Maps (Figures 1, 2 and 3)** – Explanation of data collection zones (traffic survey zones), and division of the City into impact fee service areas for roadway, water, and wastewater facilities.
- III. **Base Year Data** – Information on population, employment, and land use for Waxahachie as of 2020 for each capital facility service area.
- IV. **Ten-Year Growth Assumptions** – Population and employment growth assumptions for ten years by impact fee service area.
- V. **Ultimate Population Projection** – Projections that reflect a completely developed condition based upon the City's ultimate "build-out" scenario.
- VI. **Summary** – Brief synopsis of the land use assumptions report.

## 2. METHODOLOGY

Based on the growth assumptions and the capital improvements needed to support growth, it is possible to develop an impact fee structure that fairly allocates improvement costs to growth areas in relation to their impact on the entire infrastructure system. The database and projections in this report have been formulated using reasonable and generally accepted planning principles.

These land use assumptions and future growth projections take into consideration several factors influencing development patterns, including the following:

- The character, type, density, and quantity of existing development
- Existing zoning patterns
- Anticipated future land use (as shown on the City's Future Land Use Plan)
- Availability of land for future expansion
- Current and historical growth trends within the City
- Building permit activity trends
- Employment and population absorption rates
- Physical holding capacity of the City
- Known or anticipated development projects

Following is the general methodology used for the preparation of this report:

1. Update impact fee service areas as necessary for roadway, water, and wastewater facilities (see 3. Data Collection Zones & Service Area Maps).
2. Collect/determine benchmark data on population, employment, and land use as of 2020 (see 4. Base Year Data).
3. Project population and employment growth for ten years by impact fee service area (see 5. Ten-Year Growth Assumptions).
4. Project the ultimate population for a fully developed City (see 6. Ultimate Population Projection).

More detailed discussion for each of the above is contained within the respective sections.

## 3. DATA COLLECTION ZONES & SERVICE AREA MAPS

### Data Collection Zones

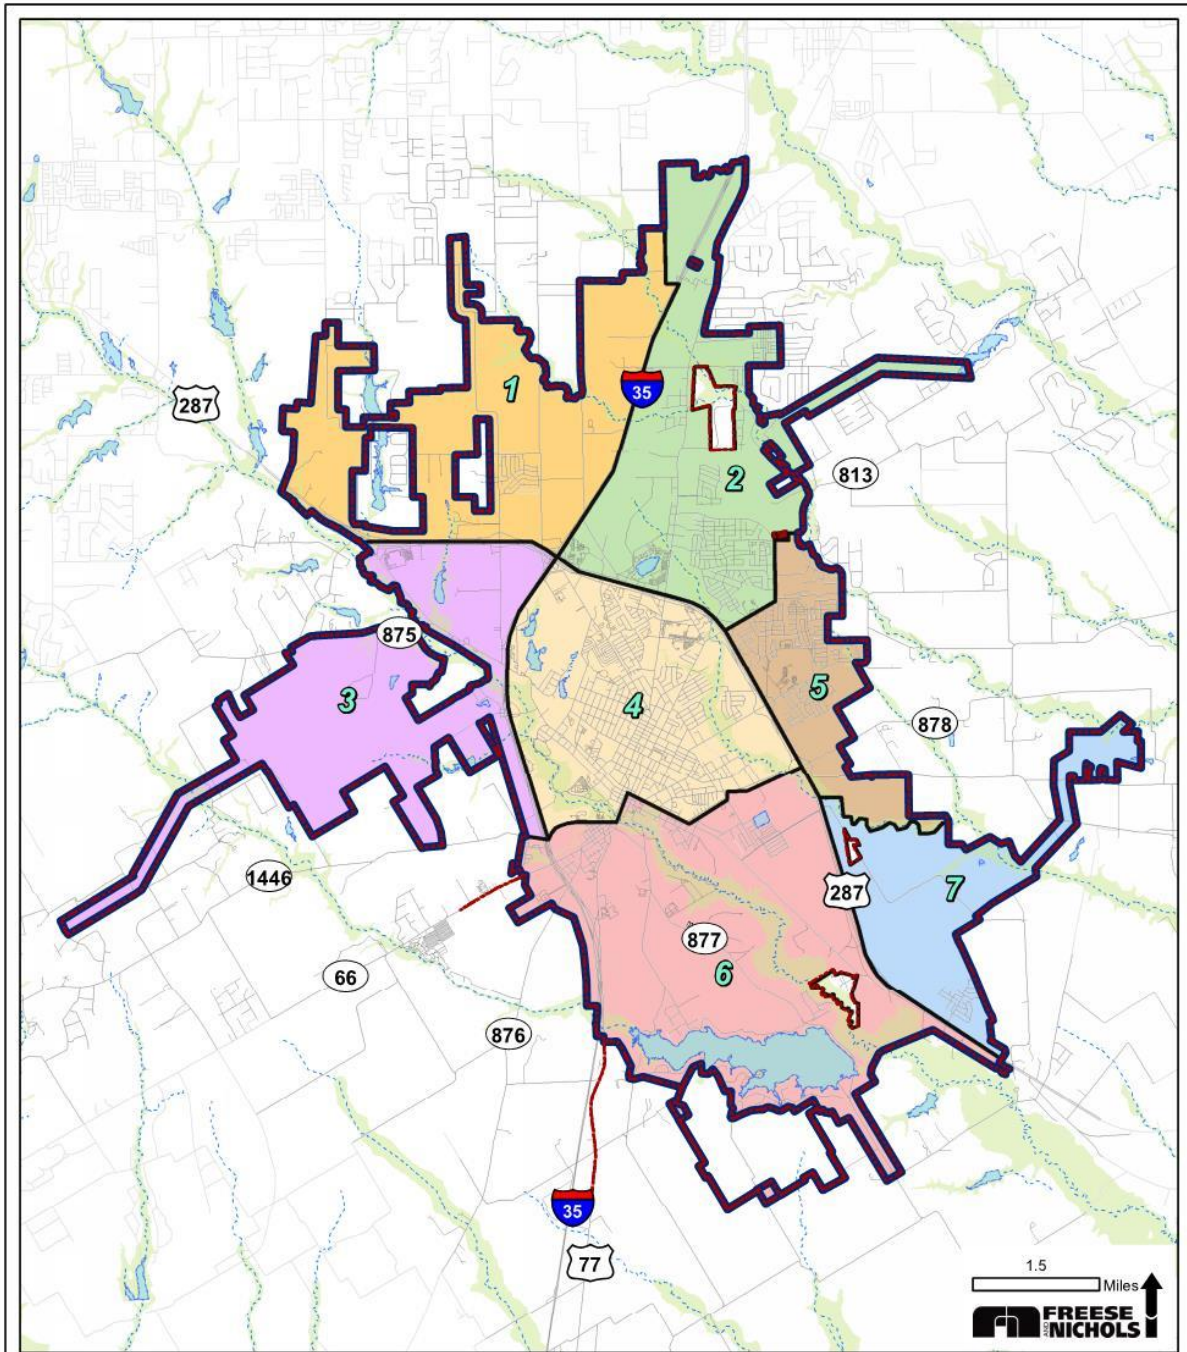

The data collection zones used for the land use assumptions are based on the 2020 demographic modeling structure from the North Central Texas Council of Governments (NCTCOG), composed of small geographic areas known as traffic survey zones (TSZs). A TSZ is a type of data collection zone that has been established by NCTCOG for all areas within the region, including areas within the corporate City limits of Waxahachie. Data sets in a TSZ include occupied households, the basis for the projections in this report. The TSZs within Waxahachie vary in size from about 50 acres to several hundred acres.

TSZs are formulated on the basis of homogeneity and traffic generation potential using major arterials, creeks, railroad lines and other physical boundaries for delineation. Since part of the data needed for the calculation of roadway impact fees is required to be compiled by TSZs, the land use assumptions are compiled by the same TSZs used by NCTCOG or combinations thereof. These TSZs are aggregated into different geographic boundaries to form service areas for roadway impact fees. The service area structure for roadway impact fees has remained unchanged since the 2015 impact fee update except for the inclusion of any annexed or de-annexed areas.

### Service Area Maps

**Figure 1**, entitled "Roadway Impact Fee Service Area Structure", details the seven service area structures for roadway facilities. All of the roadway service area boundaries encompass several TSZs and, in accordance with Chapter 395 of the Texas Local Government Code, are no more than six miles. Although the capital improvements plan and impact fees will be prepared as a separate document for roadway facilities, the geographic boundaries of the roadway service areas will be as shown on **Figure 1** for both documents. In addition, no changes have been made to the geographic boundaries of the roadway service areas since the last update of this report.

**Figure 2** and **Figure 3** show the service areas for water and wastewater facilities, respectively. The boundary for water facilities is the existing water service area as defined by the current Certificate of Convenience and Necessity (CCN). The boundary for the wastewater facilities is the general area of the City's extraterritorial jurisdiction. Documents containing the capital improvements plan for water and wastewater facilities will also be prepared separately.

## Data Format

The existing database, as well as the future projections, were formulated according to the following format and categories:

<b>Service Area</b>	Correlates to the proposed roadway, water and wastewater service areas identified in <b>Figures 1, 2 and 3</b> .
<b>Traffic Survey Zone (TSZ)</b>	Geographic areas established by the NCTCOG for modeling purposes, used for data collection purposes and termed TSZs within this report.
<b>Housing Units (2020)</b>	All housing units including single-family, duplex, multi-family and group quarters. The number of existing housing units has been shown for the base year (January 2020). Housing unit projections for the City limits were taken from NCTCOG's 2015 estimates and were projected by Freese and Nichols, Inc. (FNI) to 2020 using building permit data provided by the City. Housing unit projections relating to the Water and Wastewater service boundaries were derived from NCTCOG's 2018 projections, interpolated to January 2020.
<b>Housing Units (2030)</b>	Projected housing units by service zone for January 2030 (ten-year growth projections).
<b>Population (2020)</b>	Existing population for the base year (January 2020).
<b>Population (2030)</b>	Projected population by service zone for the year 2030 (ten-year growth projections).
<b>Employment (2020, 2030)</b>	<p>For this report, employment projections were taken from NCTCOG's 2018 estimates and interpolated by FNI to January 2020. Employment data is aggregated into three employment sectors by NCTCOG and include basic, retail and service. The following details which types of businesses fall within each of the three sectors:</p> <ul style="list-style-type: none"><li>• <u>Basic</u> – Land use activities that produce goods and services such as those that are exported outside the local economy; manufacturing, construction, transportation, wholesale trade, warehousing and other industrial uses.</li><li>• <u>Retail</u> – Land use activities that provide for the retail sale of goods that primarily serve households and whose location choice is oriented toward the household sector such as grocery stores, restaurants, etc.</li><li>• <u>Service</u> – Land use activities that provide personal and professional services such as financial, insurance, government, and other professional and administrative offices.</li></ul>

# 4. BASE YEAR DATA

This section documents the City’s historical growth trends and data to the base year of January 1, 2020. This “benchmark” information provided a starting basis of data for the ten-year growth assumptions that are presented within the following section.

## Population Growth

One method of predicting future growth is looking at past growth. Per the U.S. Census, the historical populations for Waxahachie from 1940 to 2020 are shown below:

YEAR	POPULATION
1940	8,655
1950	11,204
1960	12,749
1970	13,452
1980	14,624
1990	18,168
2000	21,426
2010	30,152
2020 <sup>(1)</sup>	39,221

Source: U.S. Census  
<sup>(1)</sup> Estimate by Freese and Nichols, Inc. (FNI)

The 2020 population estimate shown above was derived from NCTCOG’s 2015 estimate of 32,670 for the City of Waxahachie, projecting to 2020 using building permit data received from City Staff from January 2015 to January 2020. After occupied housing units had been projected using the building permit data, population projections were determined using a 2.72 persons per household multiplier.

## Existing Land Use

In any projection, a documentation of existing conditions is essential. Documentation of existing land use patterns and housing units was made from evaluating the City’s Comprehensive Plan and aerial imaging. For example, many TSZs were analyzed via aerial imaging to more accurately account for existing housing units – helping to mitigate potential duplication. These evaluations were then accounted for in the baseline for future growth projections.

**Table 1** presents a summary of existing population and employment for Waxahachie and its associated water and wastewater service areas. The appendices detail data by various impact fee service areas and further, by traffic survey zones.

<b>Table 1 EXISTING POPULATION &amp; EMPLOYMENT – 2020 BY ROADWAY, WATER AND WASTEWATER SERVICE AREAS</b>

# 5. TEN-YEAR GROWTH ASSUMPTIONS

Growth is characterized in two forms: population (residential land use) and employment (nonresidential land use). A series of assumptions were made to arrive at reasonable growth rates for population and employment. The following assumptions have been made as a basis from which ten-year projections could be developed.

- Future land uses will occur as identified on the Future Land Use Plan,
- The City will be able to finance the necessary improvements to accommodate growth,
- School facilities will accommodate increases in enrollment, and
- Densities will be as projected in the Comprehensive Plan.

The ten-year projections, or land use assumptions, are based on the establishment of a reasonable growth rate that is based upon past trends or other considerations. Due to increased growth over the past decade in the Dallas/Fort Worth Metroplex, an analysis of annual growth based on data from building permit data and the U.S. Census was undertaken to provide further insight into growth trends experienced within the City.

The single-family building permit activity since 2015 in Waxahachie has fluctuated with time, ranging from 344 in 2015 to a high of 763 in 2019. Similarly, the annual growth rate for the City fluctuated dramatically from 2.6% in 2015 to 5.0% in 2019. **Table 2** presents this fluctuation in growth using single-family building permit data provided by the City. From the beginning of January 2015 to the end of December 2019, the City saw an average growth rate of 3.4%.

Table 2 Growth Projection – 2020						
Year	Total Pop. Jan. 1	Permits	Households Added	Pop. Increase <sup>(1)</sup>	Total Pop. Dec. 31	Compound Annual Growth Rate (CAGR)
2015	32,670	344	310	842	33,512	2.6%
2016	33,512	424	382	1,038	34,550	3.1%
2017	34,550	553	498	1,354	35,904	3.9%
2018	35,904	592	533	1,449	37,353	4.0%
2019	37,353	763	687	1,868	39,221	5.0%
<b>Total/CAGR (Start of 2015-End of 2019)</b>	--	2,676	2,408	6,551	--	3.4%

<sup>(1)</sup> Population increase based off persons per household (2.72)

U.S. Census data, projections from the 2016 Comprehensive Plan, and projections from the Texas Water Development Board (TWDB) reveals lower growth rates. Differences in growth rates from **Table 2** and **Table 3** may be attributed to both the Comprehensive Plan and TWDB not accounting for the significant growth the City has experienced in recent years.

<b>Table 3</b> Historical and Projected CAGR for Waxahachie, TX			
Years	U.S. Census	2016 Comprehensive Plan	TWDB
1970-1980	0.8%	--	--
1980-1990	2.2%	--	--
1990-2000	1.7%	--	--
2000-2010	3.3%	--	--
2010-2020	--	2.4%	2.4%
2020-2030	--	2.5%	1.3%
2030-2040	--	2.5%	2.0%
2040-2050	--	2.5%	2.1%
2050-2060	--	2.5%	2.0%

Sources: U.S. Census, 2016 Waxahachie Comprehensive Plan, Texas Water Development Board

Given these trends and an analysis of recommended growth rates from the 2016 Comprehensive Plan, a 3.5% annual growth rate was determined to be a reasonable rate at which Waxahachie could be expected to grow. This rate and associated data were reviewed and recommended by the Capital Improvements Advisory Committee (CIAC) in February 2020. As a point of reference, the previous land use assumption report for Waxahachie was based on a 2% growth rate.

The development of ten-year housing estimates was calculated using the 3.5% growth rate derived above. However, the growth was not projected to occur evenly throughout the roadway service areas of the City. The roadway service boundary, unlike the water and wastewater service boundaries, contains seven distinct service areas, making it important to determine population trends in each to determine where resources will be needed. While growth will generally occur throughout the city, the current City staff provided insight into the key growth areas within the community to help determine growth rate trends in each service area. The ten-year population estimates were determined by growing service areas to represent current development patterns while also generally maintaining the 3.5% overall growth rate. The household growth figures are shown by roadway service areas in **Table 4**.

<b>Table 4</b> Projected Growth by Service Area			
<b>Roadway Service Area</b>	<b>2020 Households</b>	<b>2030 Households</b>	<b>Annual Growth Rate (2020-2030)</b>

## 6. ULTIMATE POPULATION PROJECTION

An ultimate population projection was also calculated for the water and wastewater service boundaries based on the Future Land Use Plan from the 2016 Comprehensive Plan. This projection determines buildout, meaning all areas accounted for have been developed or redeveloped in conformance with the Future Land Use Plan and its corresponding Future Land Use categories. **Table 8** shows the total buildout population by residential category for the water service boundary – estimated to be roughly 130,000. **Table 9** shows the total buildout population by residential category for the wastewater service boundary – estimated to be roughly 409,000.

In comparison to the ultimate population projections from the 2013 Land Use Assumption Report, it is important to note that buildout projections from the 2013 report were based on the Future Land Use Plan from the 2007 Comprehensive Plan. Given that the previous study's ultimate population projections were estimated at 164,291 for the water service area and 327,094 for the wastewater service area, it is evident that density increased in many areas of the City's extraterritorial jurisdiction in the 2016 Future Land Use Plan.

<b>Table 8</b>

## 7. SUMMARY

- The existing estimated population of Waxahachie is 39,221 persons, and the existing estimated employment is 31,820 jobs.
- An average annual growth rate of 3.5 percent was used to calculate the Waxahachie ten-year population growth projections for all service area boundaries.
- The ten-year (2030) growth projection of Waxahachie’s City limits is 55,326 persons, and the ten-year employment projection is 40,000 jobs.
- The ultimate population of Waxahachie’s combined City limits and extraterritorial jurisdiction is projected to be approximately 408,898 persons.

# APPENDICES

## Data Format for Appendices “A” and “B”

The land use assumptions database (Appendices “A” and “B”), as well as future projections, were formulated according to the following format and categories:

### Appendix "A" - Ten-Year Population Projections

<b>Roadway Service Area</b>	Correlates to the roadway service areas identified on <b>Figure 1</b> .
<b>2020 Households</b>	Households represent all occupied dwelling units in 2020.
<b>2020 Population</b>	The 2020 calculated population for each TSZ.
<b>2030 Households</b>	Occupied dwelling units per TSZ in 2030.
<b>2030 Population</b>	The 2030 projected population tabulated for each TSZ and roadway service area.
<b>Traffic Survey Zone (TSZ)</b>	Traffic survey zones previously established by the NCTCOG for data collection purposes and termed TSZs in this report.

### Appendix "B" - Ten-Year Employment Projections

<b>Roadway Service Area</b>	Correlates to the roadway service areas identified on <b>Figure 1</b> .
<b>Employment</b>	Three classifications were used for employment and compiled for each roadway service area: <ul style="list-style-type: none"><li>• <u>Basic</u> – Land use activities that produce goods and services such as those that are exported outside the local economy: manufacturing, construction, transportation, wholesale trade, warehousing and other industrial uses.</li><li>• <u>Retail</u> – Land use activities that provide for the retail sale of goods that primarily serve households and whose location choice is oriented toward the household sector such as grocery stores, restaurants, etc.</li></ul>

- Service – Land use activities that provide personal and professional services such as financial, insurance, government, and other professional and administrative offices.

**Total Employment**

The total of the Basic, Retail, and Service employment categories.

**CITY OF WAXAHACHIE  
2020 REVIEW AND UPDATE  
OF THE  
WATER AND WASTEWATER IMPACT FEES**

**A. INTRODUCTION**

Chapter 395, of the Local Government Code is an act that provides guidelines for financing capital improvements required by new development in municipalities, counties, and certain other local governments. Under Chapter 395, political subdivisions receive authorization to enact or impose impact fees on land that is located within their political subdivision’s corporate boundaries or extraterritorial jurisdictions. No governmental entity or political subdivision can enact or impose an impact fee unless they receive specific authorization by state law or by Chapter 395.

An “Impact Fee” is a charge or assessment imposed by a political subdivision for new development within its service area in order to generate revenue for funding or recouping the costs of capital improvements of facility expansions necessitated by and attributable to the new development.<sup>1</sup> The City of Waxahachie Water Service Area is all land within the current water Certificate of Convenient and Necessity CCN (Certificate No. 10915). The City of Waxahachie Wastewater Service Area is all land within the current sewer CCN (Certificate No. 20361) and extending to the Extra Territorial Jurisdiction (ETJ). The Water and Wastewater Service Areas are shown on Figure 1. The first step in determining an impact fee is preparation of land use and growth assumptions for the service area for the next ten years. That step has been completed by a third-party consultant, contracted by the City of Waxahachie. Next, a Capital Improvements Plan must be created to describe the water and wastewater infrastructure that will be necessary to serve the anticipated land uses and growth. The following items can be included in the impact fee calculation:

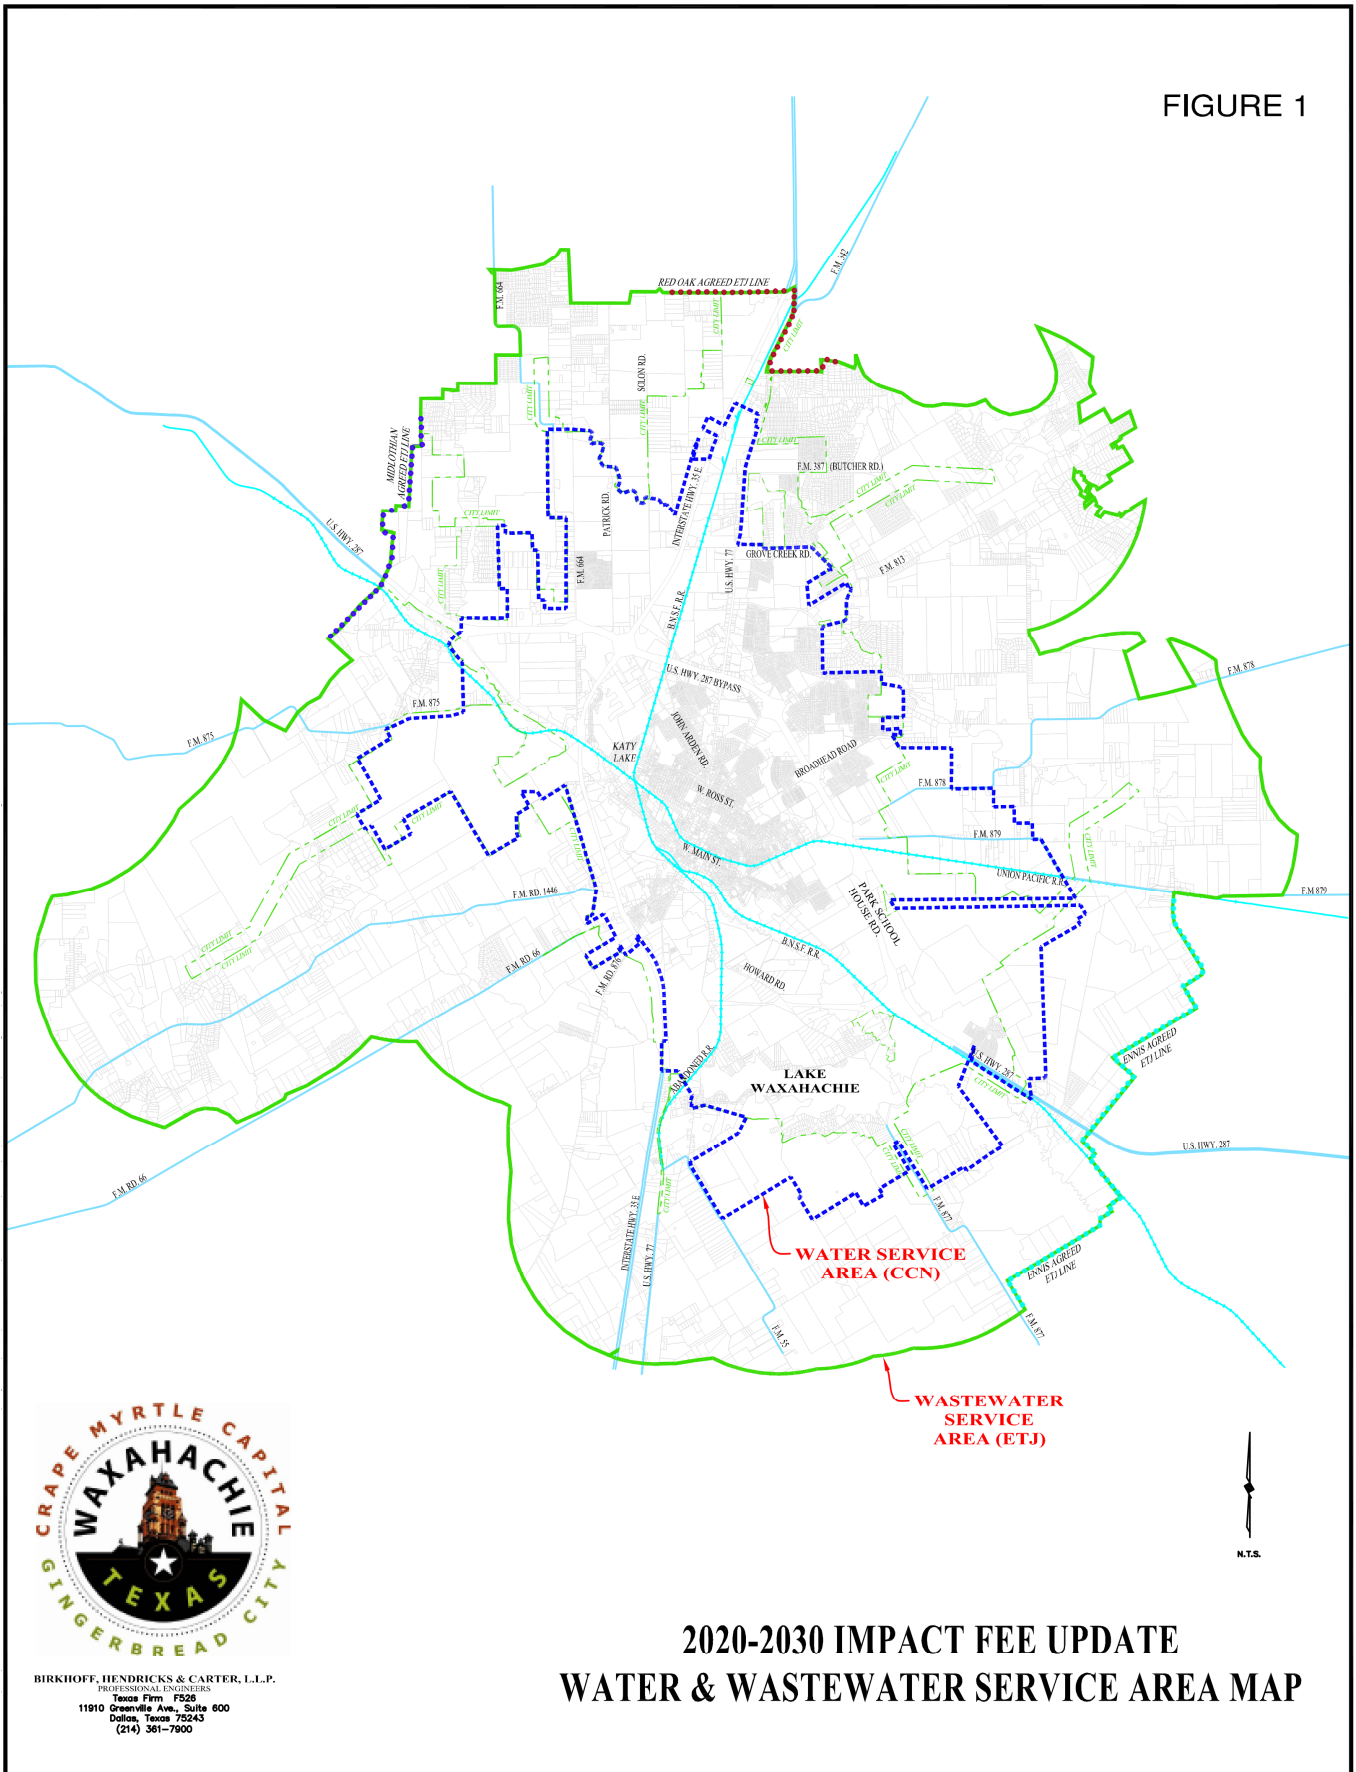

- 1) The portion of the cost of the new infrastructure that is to be paid by the City, including engineering, property acquisition and construction cost.
- 2) Existing excess capacity in lines and facilities that will serve future growth, and which were paid for in whole by the City or in part by the City with Developer participation.
- 3) Interest and other finance charges on bonds issued by the City to cover its portion of the project cost.

---

<sup>1</sup> P. 831, Texas Local Government Code, West’s Texas Statutes and Codes, 1998 Edition.

FIGURE 1

These items are summed, and the utilized capacity is calculated over the impact fee period. The maximum allowable impact fee per service unit may not exceed fifty percent of the calculated maximum amount of the total utilized capital improvement cost divided by the total number of new standard service units. This maximum allowable impact fee recovers a portion of the City’s costs to construct facilities to serve the new developments and growth. However, the City may recover the maximum fee by crediting the portion of utility service revenue generated by new service units during the 10-year program period.

The City of Waxahachie established water and wastewater impact fees by Ordinance No. 2494 on November 17, 2008 and updated the imposed amounts by Ordinance No. 2830 on November 11, 2015. The maximum calculated impact fee by the 2015 update and current imposed impact fees are summarized below:

<b>Impact Fee Per Service Unit – 2015 Update</b>		
	<b>Maximum Calculated Fee</b>	<b>Fees Imposed (Ordinance No. 2830)</b>
Water	\$2,100.00	\$1,499.00
Wastewater	\$3,082.00	\$1,987.00

Chapter 395 requires that an update of the land use assumptions, capital improvement plan, and impact fees be performed every five years, unless it is determined by the political subdivision after a review that such an update is not necessary.

This document constitutes the 2020 update of the City’s water and wastewater Capital Improvements Plans (CIP), and the resulting revision of the maximum allowable impact fees. As required by state law, the study period is a ten-year period with 2020 as the base year. The engineering analysis of the water and wastewater systems is based on established land use in year 2020 and on projected land uses in the year 2030 and at Buildout. Those land uses determine the utilization of the existing and proposed infrastructure.

The engineering analysis portion of the City of Waxahachie, 2020 Impact Fee Update determines utilized capacity cost of the water distribution and wastewater collection systems between the year 2020 and 2030. At the direction of the City, two analysis methods were considered, a “10-Year” approach based on a CIP limited to the geographical bounds of the 10-year growth area, and a “Full System” approach based on a CIP extending to the buildout planning area, generally consistent with the water and wastewater master plans. Both methods are based on the projected 10-year population growth, as estimated in the Land Use Assumptions. The maximum impact fee was calculated by both methods. The full-system method is presented herein at the direction of the Impact Fee Capital Improvements Advisory Committee and City Council.

**B. LAND USE ASSUMPTIONS SUMMARY**

Under Chapter 395, of the Local Government Code, “Land Use Assumptions” includes a description of service area and projections of changes in land uses, densities, intensities, and population in the service area for a minimum of a 10-year period. In order to impose an impact fee, the City must adopt an order, ordinance, or resolution that establishes a public hearing date to consider the land use assumptions within the designated service area. After the public hearing on the land use assumptions, the City makes a determination of adoption or rejection of the ordinance, order or resolution approving the land use assumptions, that will be utilized to develop the capital improvement plan.

The Land Use Assumptions used in this update were prepared by the City of Waxahachie’s planning consultant, Freese & Nichols, Inc., and are presented in a separate document. The Land Use Assumptions for the 2020 Impact Fee Update was utilized to establish the Land Use Summary for the water and wastewater systems in Table 1.

**TABLE NO. 1**  
**LAND USE SUMMARY**

Year	Water		Wastewater	
	Population	Employment	Population	Employment
2020	36,110	29,934	59,756	34,513
2030	48,779	37,769	83,378	44,367
Buildout	129,749	Not Projected	408,898	Not Projected

### C. DEFINITION OF A SERVICE UNIT – WATER AND WASTEWATER

Chapter 395 of the Local Government Code requires that impact fees be based on a defined service unit. A “service unit” means a standardized measure of consumption, use generation, or discharge attributable to an individual unit of development calculated in accordance with generally accepted engineering or planning standards. The City of Waxahachie has previously defined a water and wastewater service unit to be a 5/8 x 3/4-inch water meter and has referred to these service units as Single-Family Living Unit Equivalents (SFLUE). The service unit is based on the continuous duty capacity of a 5/8 x 3/4-inch water meter. This is the typical meter used for a single family detached dwelling, and therefore is considered to be equivalent to one “living unit”. Other meter sizes can be compared to the 5/8 x 3/4-inch meter through a ratio of flow rates as published by the American Water Works Association as shown in Table No. 2 below. This same ratio is then used to determine the proportional water and sewer impact fee amount for each water meter size.

**TABLE NO. 2**  
**LIVING UNIT EQUIVALENCIES**  
**FOR VARIOUS TYPES AND SIZES OF WATER METERS**

<b>Meter Type</b>	<b>Meter Size</b>	<b>Continuous Duty Maximum Rate (gpm) <sup>(a)</sup></b>	<b>Living Unit Per Meter</b>
Simple	5/8” x 3/4”	10	1.0

Turbine	10”	2,500	250.0
Turbine	12”	3,300	330.0

<sup>(a)</sup> Source: AWWA Standard C700 (2002) - C702 (2001)

**D. CALCULATION OF WATER & WASTEWATER - LIVING UNIT EQUIVALENTS**

The City of Waxahachie provided the existing water meter count by size as of July 2020. In total, 13,561 water meters serve the existing community of 36,110 residents and businesses in the Water Service Area. Table No. 3 shows the number of new living unit equivalents (LUE's) calculated for the water system in the 10-year period based on projected population growth, existing meter counts, and the living unit equivalency factors.

**TABLE NO. 3**  
**WATER LIVING UNIT EQUIVALENTS BY METER SIZE**

Meter Size	2020			2030			New Living Units During Impact Fee Period
	Meter Count	Living Units per Meter	Total Living Units	Meter Count	Living Units per Meter	Total Living Units	
5/8" x 3/4"	12,261	1.00	12,261	16,563	1.00	16,562	4,301
1"	620	2.50	1,550	838	2.50	2,093	543
1½"	141	5.00	705	190	5.00	952	247
2"	423	10.00	4,230	571	10.00	5,714	1,484
3"	44	24.00	1,056	59	24.00	1,426	370
4"	49	42.00	2,058	66	42.00	2,780	722
6"	18	92.00	1,656	24	92.00	2,236	580
8"	3	160.00	480	4	160.00	648	168
10"	2	250.00	500	3	250.00	675	175
<b>Totals:</b>	<b>13,561</b>		<b>24,496</b>	<b>18,319</b>		<b>33,086</b>	<b>8,590</b>

Similarly, the City identified the number of water meters associated with wastewater accounts as of July 2020. Table No. 4 shows the projected new LUE's in the 10-year period for the wastewater system.

**TABLE NO. 4**  
**WASTEWATER LIVING UNIT EQUIVALENTS BY METER SIZE**

Meter Size	2020			2030			New Living Units During Impact Fee Period
	Meter Count	Living Units per Meter	Total Living Units	Meter Count	Living Units per Meter	Total Living Units	
5/8" x 3/4"	11,711	1.00	11,711	16,340	1.00	16,340	4,629
1"	337	2.50	842	470	2.50	1,175	333
1½"	93	5.00	465	130	5.00	648	183
2"	327	10.00	3,270	456	10.00	4,562	1,292
3"	42	24.00	1,008	59	24.00	1,406	398
4"	49	42.00	2,058	68	42.00	2,871	813
6"	18	92.00	1,656	25	92.00	2,310	654
8"	3	160.00	480	4	160.00	669	189
10"	2	250.00	500	3	250.00	697	197
<b>Totals:</b>	<b>12,582</b>		<b>21,990</b>	<b>17,556</b>		<b>30,678</b>	<b>8,688</b>

**E. WATER DISTRIBUTION SYSTEM, RAW WATER SUPPLY, AND TREATMENT**

Hydraulic models of the City's water system were updated to reflect recently constructed projects and future projects associated with buildout development conditions. The models were loaded based on residential population projections by the North Central Texas Council of Governments (NCTCOG) traffic survey zones as provided in the Land Use Assumptions Report prepared by the City of Waxahachie's Planning consultant, Freese & Nichols. Model loads were assigned for employment projections in a similar manner. These modeled facilities include major distribution lines, pump stations, ground storage reservoirs and elevated storage tanks.

The models were run for a 72-hour Extended Period Simulation to ensure proper sizing of the facilities to meet peak demand periods.

**1) Existing Pump Stations, Ground Storage Reservoirs & Elevated Storage Tanks**

The existing water distribution system includes the facilities as shown below:

**TABLE NO. 5  
WATER DISTRIBUTION SYSTEM  
EXISTING PUMP STATIONS & GROUND STORAGE**

<b>Pump Station</b>	<b>Number Of Pumps</b>	<b>Firm Capacity (MGD)</b>	<b>Number of Ground Storage Reservoirs</b>	<b>Total Ground Storage Available (MG)</b>
Howard Rd. Water Treatment Plant Pump Station	4	12.5	3	4.5
Central Pump Station **	3	3.6	1	0.4
Grand Avenue Pump Station *	3	4.3	1	1.0
Indian Pump Station*	4	7.8	1	2.0
Sokoll Water Treatment Plant Pump Station	4	12.0	1	4.0
<b>Total:</b>	<b>18</b>	<b>40.2</b>	<b>7</b>	<b>11.9</b>

\* These pump stations will be on stand-by service by 2030.

\*\* Central Pump Station is anticipated to be decommissioned and demolished by 2025.

**TABLE NO. 6**  
**WATER DISTRIBUTION SYSTEM -- EXISTING ELEVATED STORAGE**

Elevated Storage Tanks	Capacity in Million Gallons
Highland Ave. Elevated Storage Tank	0.75
Solon Road Elevated Storage Tank	0.75
Indian Elevated Storage Tank	1.50
F.M. 664 Elevated Storage Tank	2.00
<b>Total:</b>	<b>5.00</b>

The pump stations and ground storage facilities were analyzed on the maximum daily water demand, while elevated storage tanks act dynamically and were therefore analyzed utilizing the difference between the maximum hourly demand and the maximum daily demand.

## 2) Water Distribution Lines

The water distribution lines consist of all lines within the service area planning boundary supplying water to customers in the City of Waxahachie. Water lines vary in size from 3/4-inch service lines to 24-inch and larger transmission lines. Unless a smaller diameter water line is expected to be constructed by the City, only those water lines larger than 12-inches in diameter were considered in the Impact Fee calculations. The cost of water distribution lines includes construction cost, appurtenances (water valves, fire hydrants, taps, etc.), utility relocations, purchase of easements and engineering costs. Actual costs were used for those existing projects where records were available and provided by the City. Financing cost is included for each project assuming a bond rate of 4.5% over a 20-year term.

Unit cost for water lines larger than 12-inches in diameter, which are anticipated to be constructed by private development, include the City's oversize cost participation only. City initiated water lines include the full cost of the proposed facility. Developer initiated water line projects which are 12-inches or less in diameter are not included in this Impact Fee analysis, as the cost for these size lines are the responsibility of the developer.

### 3) Existing Raw Water Supply & Treatment

The City of Waxahachie currently draws raw water from Lake Waxahachie and Lake Bardwell and transfers the raw water to the existing water treatment plant on Howard Road for treatment. The City also receives raw water from the Tarrant Regional Water District (TRWD) and treats the raw water at the existing R. W. Sokoll Water Treatment Plant on U.S. 77.

The existing raw water supply and treatment includes the rights and facilities shown below:

**TABLE NO. 7  
RAW WATER RIGHTS**

Existing Water Rights	Average Day Rights in MGD
Lake Waxahachie	3.187
Lake Waxahachie (Reuse from Lake Bardwell)	4.578
Lake Bardwell	3.857
Tarrant Regional Water District	4.650
<b>Total:</b>	<b>16.272</b>

**TABLE NO. 8  
RAW WATER SUPPLY LINES & PUMP STATION**

Raw Pump Station	Number of Pumps	Rated Capacity (MGD)	Water Line Size (Inches)	Water Line Capacity (MGD)
Lake Waxahachie Raw Water Pump Station No. 1	3	7.2	20"	10
Lake Waxahachie Raw Water Pump Station No. 2	4	19.4	2-20" & 36"*	27
Lake Bardwell Pump Station	3	13.1	20" & 27"	19.7
Tarrant Regional Water District	N/A	N/A	48"	30.2
<b>Total</b>	<b>10</b>	<b>39.7</b>		<b>86.9</b>

\*36" water line will be constructed by 2030.

**TABLE NO. 9  
TREATMENT PLANT CAPACITY**

Treatment Plant	Capacity in (MGD)
Howard Road Water Treatment Plant (Howard Rd.)	18.2
R. W. Sokoll Water Treatment Plant (U.S. 77)	10.0*
<b>Total:</b>	<b>28.2</b>

\*4.65 MGD contracted from TRWD.

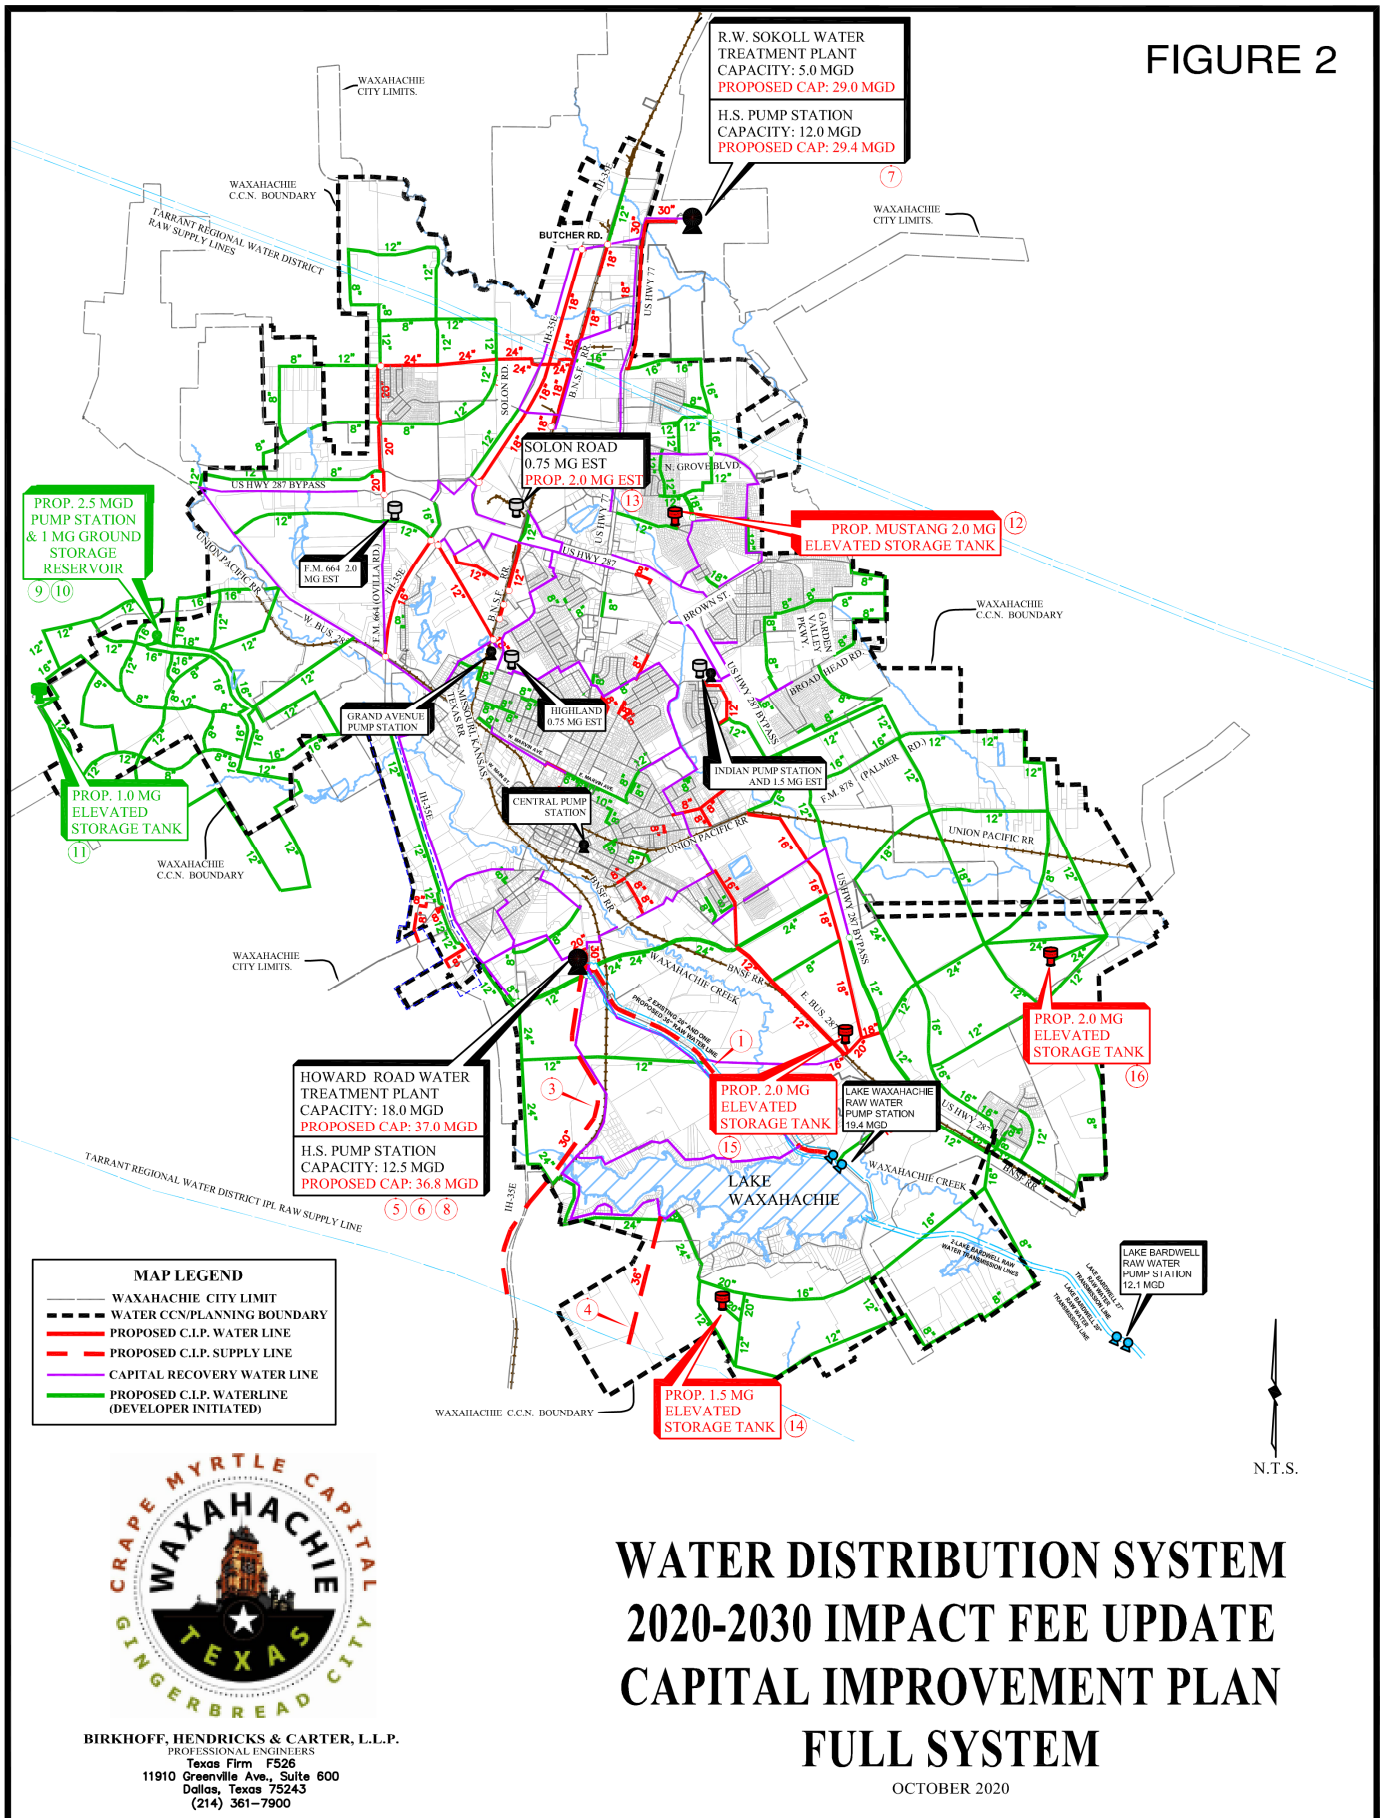

**4) Capital Improvement Plan**

The additions to the 2020 Water Distribution System, which are included in the Impact Fee study period, are shown in Figure 2 on the following page.

In order to meet the demands of the anticipated growth over the next 10-years, as provided in the Land Use Assumption Report, certain water distribution system improvements are required. Figure 2 shows the recommended total system improvements. Table No. 10 itemizes each project and the project cost.

Actual capital cost, including construction, engineering, and easements of the various elements of the existing water distribution and wastewater collection system was utilized where the information was known. The existing cost of facilities was determined from records provided by the City of Waxahachie. Where actual costs are not known, an average cost in 2020 dollars has been calculated. The average unit cost is from a limited survey of projects, which bid recently, plus an estimated cost for engineering and easements. These recommended improvements form the basis for the Water System Capital Improvement Plan and totals \$143,334,042. Adding the cost of financing brings the total Water System Capital Improvement Plan cost to \$220,379,366.

	715/791 Boundary Line Adjustment	\$2,400,000	\$1,290,055	\$3,690,055	\$3,690,055
	<b>SUBTOTAL:</b>	<b>\$36,932,042</b>	<b>\$19,851,816</b>	<b>\$56,783,858</b>	<b>\$27,323,725</b>
	<b>PROPOSED WATER SYSTEM TOTAL:</b>	<b>\$143,334,042</b>	<b>\$77,045,324</b>	<b>\$220,379,366</b>	<b>\$44,721,105</b>

## Notes:

- (1) Opinion of Cost includes:
  - a) Engineer's Opinion of Construction Cost
  - b) Professional Services Fees (Survey, Engineering, Testing, Legal)
  - c) Cost of Easement or Land Acquisitions
- (2) Debt Service based on 20-year simple interest bonds at 4.5%
- (3) \* Developer initiated construction of proposed water lines 12-inch and smaller, with City participation in oversize cost  
 \*\* Developer initiated construction of proposed facilities, with 20% City participation in project cost

## 5) Utilized Capacity

Utilized capacity for the water distribution system was calculated based on the size of water line required for each model year (2020, 2030 and Buildout). The models of the water distribution system are based on the 72-hour extended period simulation (EPS). The raw water pump stations, the water treatment plants, and pump stations capacities are generally based on the average or maximum daily system demand, while transmission and distribution facilities are sized based on either the maximum hourly demand or the minimum hourly demand, whichever demand is greater for a particular water line. Often times, the capacity of a water line is determined by the flows generated by the minimum hourly demand. The minimum hourly flows are usually higher in those lines which are used to refill elevated storage. Table No. 11 below shows the unit flow assumptions used for analysis of each element of the distribution system:

**TABLE NO. 11**  
**WATER DISTRIBUTION SYSTEM ANALYSIS**  
**BASIS OF DEMAND CALCULATION**

Type of Facilities	Demand Type	Impact Fee Per Capita Use
Pumping	Maximum Day	350 gallons/day per person
Distribution System	Maximum Hour	693 gallons/day per person
Ground Storage	Maximum Day x 6 Hours / 24 Hours / Day	
Elevated Storage	Maximum Hour (Distribution) – Maximum Day (Pumping) x 6 Hours / 24 Hours / Day	

For each line segment in the water distribution model, the Buildout flow rate in any given line was compared to the flow rate in the same line for the 2020 and the 2030 models. The utilized capacity was then calculated for each year based on the Buildout being 100 percent capacity. The utilized capacity during the Impact Fee period is the difference between the year 2020 percent utilized and the year 2030 percent utilized. The utilized capacity for each water distribution facility, both existing and proposed, is presented by the Impact Fee Capacity Calculation Tables provided in Appendix A. Table No. 12 summarizes the cost and the utilized capacity of the proposed water lines, pump stations, ground storage reservoirs and elevated storage facilities included, and the capital recovered in the impact fee period of 2020-2030. Table No. 12 also summarizes the cost and the utilized capacity for the existing lakes, water rights, treatment plants, water lines, pump stations, ground storage reservoirs and elevated storage facilities included and the capital recovered in the impact fee period.

**TABLE NO. 12**  
**SUMMARY OF ELIGIBLE CAPITAL COST & UTILIZED CAPACITY COST**

<b>Water System</b>	<b>Total 20-Year Project Cost</b>	<b>Utilized Capacity Cost During Fee Period</b>
Existing Water Lines	\$23,847,787	\$2,831,133
Existing Water Facilities	\$88,850,274	\$8,675,553
Existing Water System Planning Expenses	\$30,000	\$30,000
<b>Existing Water System Subtotal:</b>	<b>\$112,728,061</b>	<b>\$11,536,686</b>
Proposed Water Lines	\$56,783,858	\$27,323,725
Proposed Water Facilities	\$163,595,508	\$17,397,380
<b>Proposed Water System Subtotal:</b>	<b>\$220,379,366</b>	<b>\$44,721,105</b>
<b>Total:</b>	<b>\$333,107,427</b>	<b>\$56,257,791</b>

## F. WASTEWATER COLLECTION SYSTEM

### 1) General

As part of the 2016 Wastewater Master Plan Update for the City of Waxahachie, Birkhoff, Hendricks & Carter, L.L.P. developed a hydraulic model of the wastewater collection system. The model has been refined as part of the subsequent Master Plan and Impact Fee Updates to reflect the major projects constructed. The hydraulic wastewater analysis for this study was performed with InfoSewer ProSuite, Version 7.6 Software.

### 2) Major Basins

There are thirteen (13) major drainage basins within the wastewater planning area, the ETJ. These areas are typically defined by the natural topography. Each drainage basin is divided into sub-basins, generally defined by the existing wastewater collection system, major roads, and land uses. Figure 3 illustrates that general study area boundary and identifies the major wastewater collection basins. Flows generated from these basins reach the Jefferson Street Lift Station via the City's major collection lines and are conveyed by way of parallel 30-inch and 20-inch diameter force mains to the existing Wastewater Treatment Plant owned and operated by the City. The major basin boundaries, main trunk sewer lines, and the City's major collection lines are shown on the Wastewater Collection Master Plan Map included with the 2016 Wastewater Master Plan. The following alphabetically summarizes the major basins and their respective wastewater collection requirements during this impact fee period.

#### a) Boyce Creek Basin

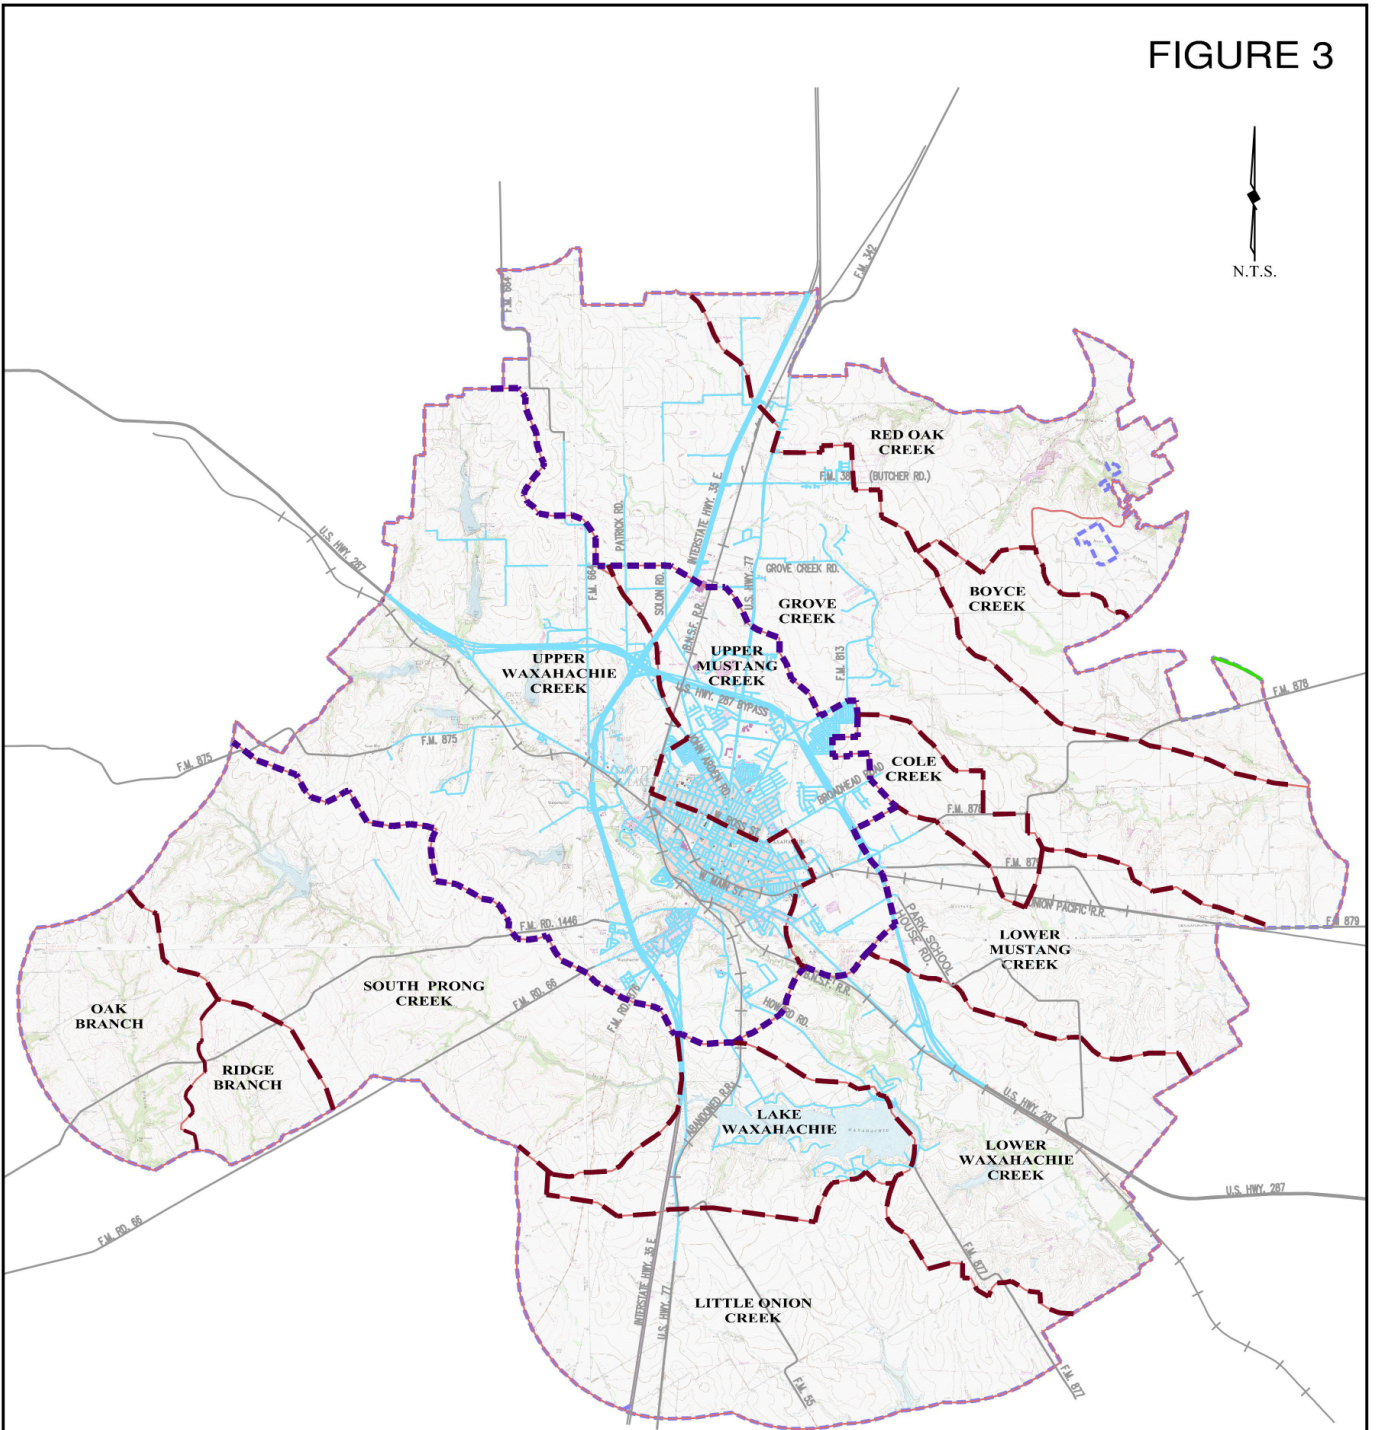

The Boyce Creek Basin is located in the far eastern portion of the planning area. Boyce Creek flows southeasterly, parallel with Grove Creek. The existing wastewater collection system does not extend to service this basin.

#### b) Cole Creek Basin

The Cole Creek basin is located in a predominantly undeveloped area in the eastern portion of the planning area. The 24-inch Cole Creek Trunk Sewer was recently completed to provide ready service in the basin. The Cole Creek Trunk Sewer relieves Broadhead Road Lift Station, and for an interim period of time, will also support the growth in the Grove Creek Basin. The Grove Creek Lift Station force main was rerouted into the most northerly segment of the Cole Creek Trunk Sewer, which flows to the Lower Mustang Creek Lift Station.

REVISED: 10/9/20 - CBURGETT

# WASTEWATER COLLECTION SYSTEM 2020-2030 IMPACT FEE UPDATE BASIN MAP

BIRKHOFF, HENDRICKS & CARTER, L.L.P.  
PROFESSIONAL ENGINEERS  
Texas Firm F526  
11910 Greenville Ave., Suite 600  
Dallas, Texas 75243  
(214) 361-7900

c) **Grove Creek Basin**

This basin collects the majority of the existing sanitary flow in the northern portion of the planning area. The Grove Creek basin is comprised of single family residential with commercial and industrial usage typically occurring along I.H. 35E. The flow in this drainage basin is pumped by the Grove Creek Lift Station located west of Grove Creek in the vicinity of Oak Creek Drive.

The Grove Creek Lift Station was recently expanded in capacity from 3.7 to 7.0 MGD, and its force main was redirected southerly to the new Cole Creek trunk sewer. The 18-inch trunk sewer upstream of the Grove Creek lift station is proposed to be paralleled with a 27-inch trunk sewer to support anticipated growth in the basin during the impact fee period.

A new lift station and trunk main is proposed in the basin, positioned downstream of the existing Grove Creek Lift Station, in east Waxahachie.

d) **Lake Waxahachie Basin**

The Lake Waxahachie Basin is located in a partially developed area in the southern portion of the planning area. This basin is not currently served by the existing collection system.

e) **Little Onion Creek Basin**

The Little Onion Creek Basin is located in an undeveloped area in the far south region of the planning area. Minimal growth is anticipated to occur in this basin during the impact fee period south of Lake Waxahachie.

f) **Lower Mustang Creek Basin**

The Lower Mustang Creek Basin is located in a future development area in the southeastern portion of the planning area. The existing flow produced by this basin is served by the existing Mustang Creek Lift Station and approximately 3-mile long, 14-inch force main. A parallel 20-inch force main is proposed to add capacity for the Mustang Creek Lift Station During the impact fee period. The 24-inch Cole Creek Trunk Sewer now connects to the 27-inch trunk sewer upstream of the Mustang Creek Lift Station. The Saddlebrook Estates off-site sanitary sewer, in the Little Waxahachie Creek basin, pumps into Lower Mustang Creek basin.

**g) Lower Waxahachie Creek Basin**

The Lower Waxahachie Creek Basin is located southeast of downtown and is distinguished from the Upper Waxahachie Creek Basin because it is downstream of the Jefferson Street Lift Station and WWTP. An interim sized lift station is proposed to provide new capacity to the upper basin during the impact fee period.

**h) Oak Branch Basin**

The Oak Branch Basin is located in the most westerly portion of the planning area and is currently not served by the existing collection system.

**i) Red Oak Creek Basin**

The Red Oak Creek Basin is in the far northeastern portion of the planning area boundary. The Red Oak Creek Basin boundary was slightly enlarged this update with the adjustment of the ETJ and planning area boundary line.

**j) Ridge Branch Basin**

The Ridge Branch Basin is in the westerly portion of the planning area boundary and lies between Oak Branch and South Prong Creek basins.

**k) South Prong Creek Basin**

The South Prong Creek Basin runs parallel with Waxahachie Creek to the south, and it is the surface water drainage area for Lake Waxahachie. Phase 1 of the South Prong Creek Lift Station is proposed during this impact fee period in response to projected growth in the upstream basin as well as its position to support flow transferred from Little Onion Creek and Lake Waxahachie basins.

**l) Upper Mustang Creek Basin**

The Upper Mustang Creek Basin is located in an established area, generally north of Ross Street and south of U.S. Highway 287 bypass. The basin is presently served by a trunk sewer (varying from 12-inch to 48-inch in diameter) following Mustang Creek from the BNSF railroad (formally M.K.T. Railroad) downstream to a point near Parks Schoolhouse Road where it crosses the natural drainage divide into the Waxahachie Creek Drainage Basin and out-falling into the Jefferson Street Lift Station. The existing facilities in this basin have adequate capacity to support growth occurring in the impact fee period.

**m) Upper Waxahachie Creek Basin**

Upper Waxahachie Creek serves the developed portion of Waxahachie south of a division line along Ross Street and Broadhead Road. This basin extends along Waxahachie Creek from the existing wastewater treatment plant on Howard Road until it meets the western portion of the planning boundary. Trunk sewer lines varying in diameter from 12 to 27-inches accommodate the flow produced by the Upper Waxahachie Creek Basin. The growth expected to occur within this basin over the duration of the impact fee period will be supported by developer initiated sanitary sewer lines ranging from 12 to 24-inches in diameter. No City initiated improvements are anticipated during the impact fee period.

**3) Collection Lines**

The wastewater collection system analysis covered all drainage basins within the study area. Recall that the basis for this impact fee update analysis is a 'Full System' configuration. In certain cases, interim facilities are required to provide service for growth areas prior to construction of the larger buildout facility. These interim improvements respond to growth and maximize the useful life of existing and interim City assets. It is assumed for the purpose of this analysis that these interim improvements will remain in service for the duration of the 10-year period, although in some cases at a reduced rate of utilization due to construction of more regional downstream improvements. Generally, sanitary sewer line sizes 12-inches in diameter and smaller were omitted from the calculation of maximum impact fee, unless identified as a City-initiated and funded capital improvement project.

The wastewater project cost includes necessary appurtenances (manholes, aerial crossings, and the like), purchase of easements, utility relocation, pavement removal and replacement, and engineering costs. For existing Impact Fee projects, actual costs were utilized where known and provided by the City. Future project cost estimates were based on 2020 average unit cost per linear feet and includes engineering, easements, and construction cost. Financing cost is included for each project assuming a bond rate of 4.5% over a 20-year term.

Unit cost for proposed sanitary sewer lines larger than 12-inches in diameter, which are anticipated to be constructed by private development, include the City's oversize cost participation only. Developer-initiated projects are shown in green on Figure 4. City-initiated sanitary sewer lines include the full cost of the proposed improvements. Developer-initiated sanitary sewer line projects which are 12-inches or less in diameter are

not included in this Impact Fee analysis, as the cost for these size lines are the responsibility of the developer.

All eligible existing sanitary sewer lines within the study area that were paid for by the City and have capacity available were included in the Impact Fee Study. The eligible existing and proposed wastewater lines and facilities are shown on Figure 4.

#### **4) Treatment**

The City of Waxahachie is currently the sole provider of wastewater collection and wastewater treatment for the Planning Area. This Impact Fee study includes the cost of the collection and treatment facilities, both existing and proposed.

The original construction of the Wastewater Treatment Plant (WWTP) was in 1974. The plant was then expanded in 1987 and again in 2005 to its current rated capacity of 8 MGD on an annual average day flow basis.

The City's wastewater treatment plant consultant, Kimley Horn & Associates, prepared the Waxahachie Wastewater Treatment Plant Master Plan Update and Biosolids Assessment in 2017, which addressed both immediate (Phase 1) and future (Phase 2) WWTP project needs and expenses. The project cost of those Phase 1 items that were found to contribute additional capacity or otherwise improve the overall ability of the plant to provide reliable service for future growth, were included in the Impact Fee study.

The future Phase 2 project identified those improvements necessary for the existing WWTP capacity expansion from 8 to 12 MGD. Considering current usage of the plant's existing 8 MGD capacity, and projected growth anticipated in the 10-year impact fee period, the planning and engineering phases for the expansion are expected to be completed, with construction started during the 10-year impact fee period.

A new WWTP, identified as Waxahachie WWTP No. 2, is also included in the Impact Fee study. WWTP No. 2 is shown to be conceptually located near the southern planning boundary in the Lower Waxahachie Creek basin.

## 5) **Capital Improvement Plan**

### a) **Proposed**

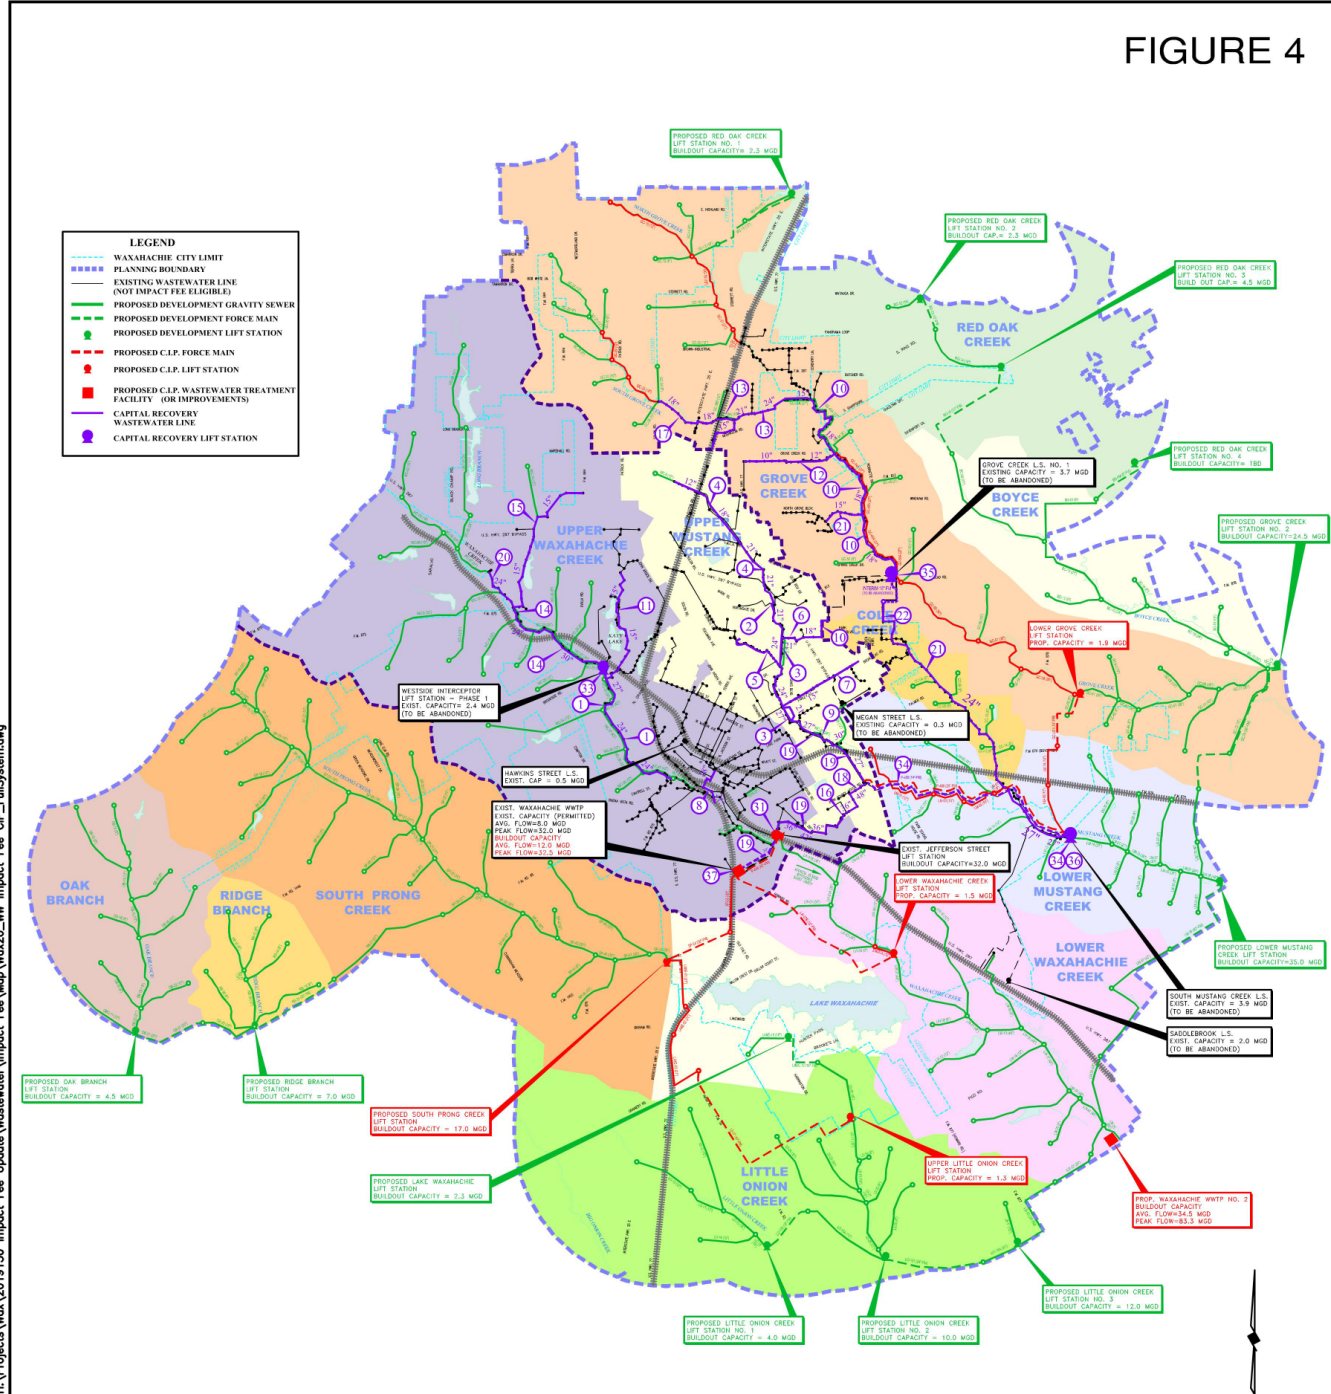

Figure 4 shows the proposed pipes and facilities used in the Full System analysis. This form of analysis was selected by the City to maximize flexibility for the City to respond to development, wherever it may occur. City-initiated projects that are proposed to provide interim lift station service in the next 10-years are also included in the analysis using estimated useful life in the calculation. It should be noted that not all of the developer-initiated pipes shown in Figure 4 are anticipated to be constructed in the 10-year period. Hydraulic model flow rates calculated from City Land Use projections determined the utilized capacities in the wastewater impact fee calculation.

Table No. 13 summarizes the costs and utilized capacity costs associated with the 10-year Capital Improvement Plan (CIP) for proposed facility and pipe projects.

### b) **Existing**

Over time as growth has occurred, the City has improved the wastewater collection system by constructing collection lines, lift stations, force mains and treatment expansions to provide capacity for the increasing wastewater flows. These projects are referred to as recovery facilities and are shown in purple on Figure No. 4. Actual capital cost, including construction, engineering, and easements of the various elements of the existing wastewater system was utilized where the information was known and provided by the City. Where actual costs are not known, an average cost was calculated.

## 6) Utilized Capacity

The utilized capacities for the wastewater collection system were calculated based on land absorption from population growth projections provided by the Land Use Assumptions prepared by Freese & Nichols. The population and employment growths were provided for sixty-five unique areas (Traffic Survey Zones (TSZ)) within the planning boundary that were established by the North Central Texas Council of Governments (NCTCOG). The growth rates in each TSZ were used to calculate 2020, 2030 and Buildout design flows that were applied to the hydraulic model. Utilized capacities were calculated using model-reported peak flow rates for each pipe segment in the analysis. The following summarizes each design flow component used to calculate the wastewater design flows.

- a) Population Based Flow (Residential): For the purpose of this wastewater impact fee study base residential units flow of 90 gallons per capita per day (gpcd). Average daily flow rates were multiplied in the model by a uniformly-applied diurnal curve pattern which allows the hydraulic model to simulate a 24-hour cycle that follows the temporal variations in a wastewater system.
- b) Non-Population Based Flow (Non-Residential): Non-residential average flows are estimated based on an average daily flow per acre for each non-residential land use category. Commercial/Retail/Public base unit flows generally ranged from 625 to 950 gallons per acre per day (gpad) in average dry weather flow conditions, while Industrial and future Mixed Use and Highway Commercial were estimated at 1,000 to 1,100 gpad.
- c) Infiltration and Inflow (I&I): Groundwater Infiltration into the sanitary sewer system occurs at faulty sewer pipe joints, breaks in sewer pipes and manholes and faulty service lines. This infiltration can create a flow burden on the wastewater collection system and treatment plant. Normal plant capacity must be designed to handle these infiltration related conditions.

Inflow is a more rapid entry of surface water to the collection system following a rainfall event. The additional flow is generally recognized to enter through manhole openings, service line cleanouts, badly deteriorated collection lines, roof drains and storm drains. Excessive inflow can cause capacity issues in the collection system, including gravity sewer Sanitary Sewer Overflows (SSO's). Excessive peak wet-weather flows contribute to the risk of exceeding treatment facility capacity.

The effects of infiltration and inflow were simulated in the hydraulic model using a 5-year/6-hour design storm.

The City is currently engaged with Birkhoff, Hendricks, & Carter, on a system-wide temporary wastewater flow monitoring program aimed at identifying areas of the existing sanitary sewer system that contribute significant inflow or infiltration volumes. One of the next steps for the City will be to rehabilitate the key areas of the system identified as high I&I contributors.

The percent-utilized capacity was calculated from comparison of hydraulic model flow rates in the Existing and 10-year development conditions. Both flow rates are converted to percentage of the Buildout flow rate for each modeled pipe segment, and the difference taken is the percent-utilized in the 10-year period. The hydraulic model loads follow the growth projections provided for year 2020, the year 2030 and for Buildout.

Table No. 14 below summarizes the project cost and utilized cost over the impact fee period of 2020 – 2030 for each element of the wastewater system. The utilized capacity for each existing and proposed wastewater facility and collection line is presented in detail in the Wastewater Impact Fee Tables.

**TABLE NO. 14**  
**SUMMARY OF ELIGIBLE CAPITAL COST & UTILIZED CAPACITY COST**

Wastewater System	Total 20-Year Project Cost	Utilized Capacity Cost During Fee Period
Existing Wastewater Collection Lines	\$25,349,103	\$6,958,717
Existing Wastewater Facilities	\$48,027,859	\$12,632,845
Existing Wastewater System Planning Expenses	\$30,000	\$30,000
<b>Existing Wastewater System Subtotal:</b>	<b>\$73,406,962</b>	<b>\$19,621,562</b>
Proposed Wastewater Collection Lines	\$124,605,620	\$10,643,530
Proposed Wastewater Facilities	\$573,105,124	\$35,433,104
<b>Proposed Wastewater System Subtotal:</b>	<b>\$697,710,744</b>	<b>\$46,076,634</b>
<b>Total:</b>	<b>\$771,117,706</b>	<b>\$65,698,196</b>

## G. CALCULATION OF MAXIMUM IMPACT FEES - WATER & WASTEWATER SYSTEM

The maximum impact fees for the water and wastewater systems are calculated separately by dividing the cost of the capital improvements or facility expansions necessitated and attributable to new development in the service area within the ten year period by the number of living units anticipated to be added to City within the ten year period as shown on Table No. 3 and No. 4. The calculations are shown below:

The <b>Water System</b> impact fee for a 5/8" x 3/4" water meter is calculated as follows:			
<b>Maximum Water Impact Fee</b>	=	$\frac{\text{Eligible Existing Utilized Cost} + \text{Eligible Proposed Utilized Cost}}{\text{Number of New Living Unit Equivalent over the Next 10 Years}}$	
	=	$\frac{\$11,536,686 + \$44,721,105}{8,590}$	= $\frac{\$56,257,791}{8,590}$
<b>Calculated Maximum Impact Fee</b>	=	<b><u>\$ 6,549.22</u></b>	
<b>*Allowable Maximum Water Impact Fee: (Max Impact Fee x 50%)</b>	=		<b><u>\$ 3,274.61</u></b>
<i>* Maximum allowable impact fee is 50% of the maximum calculated impact fee per Chapter 395 LGC</i>			

The <b>Wastewater System</b> impact fee for a 5/8" x 3/4" water meter user is calculated as follows:			
<b>Maximum Wastewater Impact Fee</b>	=	$\frac{\text{Eligible Existing Utilized Cost} + \text{Eligible Proposed Utilized Cost}}{\text{Number of New Living Unit Equivalent over the Next 10 Years}}$	
	=	$\frac{\$19,621,562 + \$46,076,634}{8,688}$	= $\frac{\$65,698,196}{8,688}$
<b>Calculated Maximum Impact Fee</b>	=	<b><u>\$ 7,561.95</u></b>	
<b>*Allowable Maximum Wastewater Impact Fee: (Max Impact Fee x 50%)</b>	=		<b><u>\$ 3,780.97</u></b>
<i>* Maximum allowable impact fee is 50% of the maximum calculated impact fee per Chapter 395 LGC</i>			

Based on the Maximum Impact Fee Calculation for Water and Wastewater, Table No. 15 calculates the maximum impact fee for the various sizes of water meters.

**TABLE NO. 15**  
**ALLOWABLE MAXIMUM FEE PER LIVING UNIT EQUIVALENT**  
**AND**  
**PER METER SIZE AND TYPE**

**50% Max . Water Impact Fee /LUE ..... \$3,274.61**  
**50% Max . Wastewater Impact Fee /LUE ..... \$3,780.97**

Meter Type	Meter Size	LUE	Maximum Impact Fee		Total
			Water	Wastewater	
Simple	5/8" x 3/4"	1	\$3,275	\$3,781	\$7,056

# INTRODUCTION

---

## Chapter 1: Introduction

Shrinking funds available for transportation improvements on city thoroughfares limit many cities from upgrading infrastructure to meet increasing travel demands. To meet the needs of new growth, many cities collect "impact fees" from new development to help fund transportation improvements necessitated by such development. What is unique about impact fees is that they often finance roadway improvements that are considered "offsite" to new development. However, when considering the traffic implications created by new development on the roadway system, impact fees provide a means by which infrastructure may keep pace with new development.

Texas initially authorized the use of impact fees with the during the 1987 legislature. Now codified in Section 395 of the Texas Local Government Codes, the legislation authorizes cities to collect fees from new developments to finance new construction or expansion of capital improvements such as road, water, and wastewater facilities. The law stipulates that all fees collected from new development must not exceed the maximum amount calculated by the methodology described therein. The law also mandates that impact fee systems be updated periodically (at least every five years) to ensure existence of excess capacity of the capital improvement plan and that costs necessitated by new growth are accurately reflected in the cost per service unit calculation. Modifications to the capital improvement plan (CIP) may be made, subject to compliance with the city's official thoroughfare plan. Amendments to the CIP also must contemplate growth need identified in land use assumptions spanning a ten-year planning period.

The impact fee program offers several advantages to both a city and new development among which include: 1) a systematic, structured approach to assessment of fees, 2) a clear, equitable distribution of costs associated with the impact of new development, 3) the ability to pool funds, as well as flexibility, for phased project implementation of specifically identified projects, 4) assurance that fees collected will be spent in the area where new development is occurring (roadway service areas), 5) up-front knowledge of fees to be imposed, and 6) credits for developer participation.

Since the inception of roadway impact fees in 2008, the program was updated in 2012 and in 2015 and has helped to fund numerous projects citywide. In each program update, the roadway capital improvements plan was amended to incorporate additional projects and has served to provide increased capacity and accessibility to growth and development throughout the city.

This program update considers amendments to land use assumptions for the ten-year planning period 2020-2030, as well as to the roadway capital improvements plan to address long-term citywide growth and development. Per procedural requirements codified in Chapter 395, technical and administrative requirements of the program have been addressed, a Capital Improvements Advisory Committee was convened to provide comment to program land use assumptions, capital improvements plan, and calculated impact fees, appropriate public noticing provided, and public hearing held to consider amendments to the roadway impact fee program.

This program update incorporates a philosophical change to the roadway CIP. In prior programs, specific projects were identified from which the cost per service unit was calculated. Monies collected from new development are used to implement those projects in the impact fee CIP, in accordance with state law.

## INTRODUCTION

---

As such, if new development were to implement improvements outside of the impact fee CIP, no impact fee monies could be used nor enabled without an impact fee CIP amendment and associated public process.

This 2020 system update incorporates the full thoroughfare network into the impact fee program to both minimize the impact fee CIP amendment process as well as enabling the ability to credit new development for off-site roadway project improvements. This approach further enables more flexibility for the use of impact fee funds towards phased improvements, as appropriate, throughout the city's major street network. From a cost of implementation perspective, this may seem a drastic departure from the traditional program however it is important to note that from a unit cost perspective, the unit cost is generally the same as only cost of needed capacity is considered in the calculation. For example, capacity consumed by ten-year growth on the traditional program was determined to be 52% (calculated and refer to Appendices for Ten-Year Analysis) versus 12% of the full-system capacity, as documented in this report.

### Study Methodology

The following steps were undertaken as part of this program update:

1. Meetings were held with the City of Waxahachie Staff and the Capital Improvement Advisory Committee to discuss technical approach, growth rates and land use assumptions, defined capital improvements plans, project costing and associated cost per service unit calculations, and program amendments for policy consideration.
2. Impact fee service areas were reviewed and amended for any city annexations. Roadway service areas are contained to the current city limits.
3. The vehicle-mile of travel (VMT) during the PM peak hour was retained as the unit of measure for the roadway impact fee system.
4. A roadway conditions inventory was conducted on Waxahachie thoroughfares for lane geometries, roadway classifications and segment lengths. New arterial and/or collector streets not previously assessed were added to the program database.
5. The existing roadway network was evaluated based on traffic volume count data collected January 2020, to determine roadway capacity, current utilization, and if any capacity deficiencies exist within each impact fee service area.
6. Projected 10-year growth, in terms of vehicle-miles of demand, was calculated for the service areas based on updated land use assumptions (projections of population and employment growth) prepared by Freese and Nichols in May 2020 and supplemented with service unit generation for residential, office, commercial and industrial land uses per an updated land use equivalency table. The Land Use Assumptions for Impact Fees report was reviewed and approved by the Capital Improvements Advisory Committee (CIAC) prior to development of VMT growth projections and capital improvements plan (CIP) update.
7. The existing impact fee CIP was evaluated with updated traffic count data to ensure that excess capacity remained within each impact fee project for retention in the program. The analysis of the

## INTRODUCTION

---

existing impact fee CIP revealed excess capacity and therefore could remain in the impact fee program.

8. A roadway impact fee CIP was amended to incorporate full-system buildout, per the current official City Thoroughfare Plan, into the impact fee program. Projects added to the impact fee program included only new lane additions to achieve thoroughfare plan standard. For example, for an ultimate six-lane roadway in which two lanes currently exist, only the difference in lanes (four additional lanes) was added to the program. This would ensure that only true capacity enhancement was considered as part of the full-system analysis and resultant cost per service unit calculation. It is important to note that an incremental 10-year traditional CIP was also developed to compare and verify that the “Full-System” program was a fair and equitable approach to the development community.
9. Roadway costs associated with construction, engineering, right-of-way, and project financing for recoupment projects were prepared by Freese and Nichols. A combination of updated construction cost estimate worksheets for the existing impact fee CIP projects and unit costing (linear foot basis) by roadway functional class for full-system roadways was prepared by individual projects. Costs for study updates are eligible for recovery and were included in the total project cost. Roadway cost data was compiled and summed by service area.
10. The cost of capacity supplied, cost attributable to new development and the maximum cost per service unit was calculated for each service area. A credit of 50% was applied to the overall cost of the capital improvements program for use in the calculation of the cost per service unit.
11. This report was prepared to document the procedures, findings, and conclusions of the study.

### Organization of Report

This report describes the background information, analysis, and findings of the study in six parts, with a chapter devoted to each:

- Roadway Impact Fee Service Areas (Chapter 2)
- Roadway Impact Fee Service Units (Chapter 3)
- Existing Conditions Analysis (Chapter 4)
- Projected Conditions Analysis (Chapter 5)
- Calculation of Impact Fees (Chapter 6)
- Conclusion (Chapter 7)

## Chapter 2: Roadway Impact Fee Service Areas

Chapter 395 requires that service areas be defined for impact fees to ensure that facility improvements are in proximity to the area that is generating need. State law mandates that roadway service areas be limited to a six-mile maximum and must be located within the current city limits. This is primarily because roadway systems are "open" to both local and regional use as opposed to a defined limit of service that is provided with water and wastewater systems. The result is that new development can only be assessed an impact fee based on the cost of necessary capital improvements within the city limits and further, within a defined service area.

Waxahachie's roadway impact fee system contains seven service areas as depicted in **Figure 1** and developed using the criteria defined in Chapter 395. Other considerations included use of physical or natural features, potential roadway projects and their relation to undeveloped areas of the community, and the planning areas used in long-range plan efforts (for consideration of service area expansion due to possible annexation).

Amendments to the service area structure include areas annexed into the city since 2015 and generally occur in the following service areas:

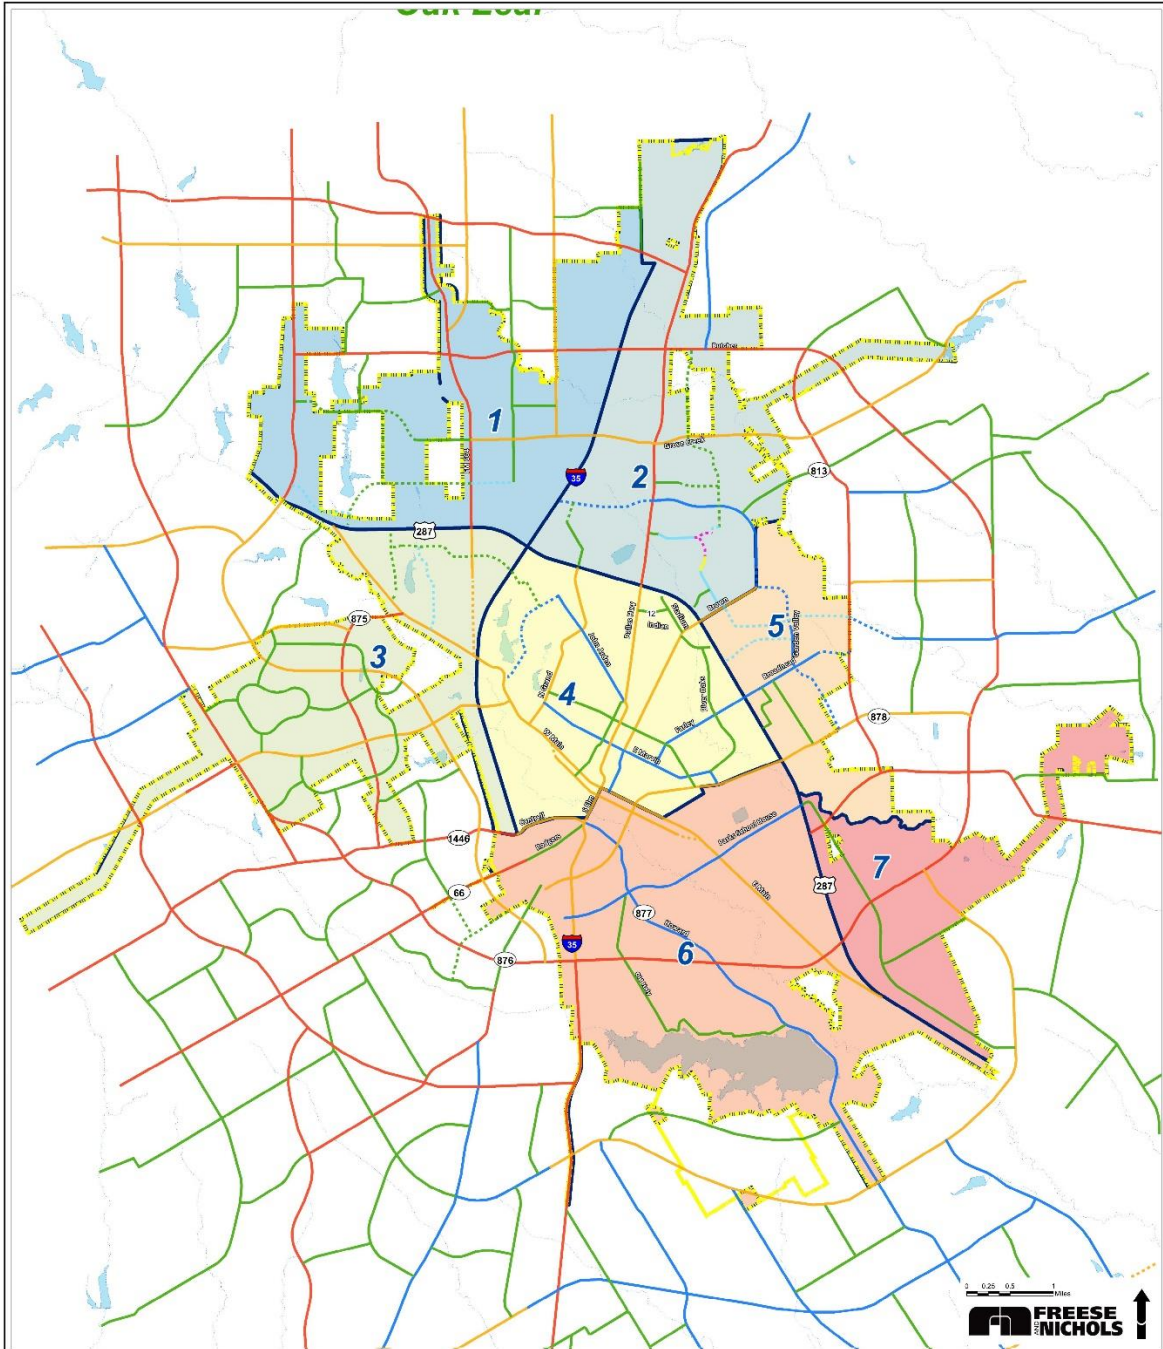

- Service Area 1: Near Marshall Road between FM 664/Ovilla Road and Black Champ Road
- Service Area 3: East of Lone Elm Road and north of FM 1446 (Emory Lakes area)
- Service Area 5: West of Broadhead Road near Youngblood Road
- Service Area 6: East of FM 877 (Howard Road) and Hunter Road

# ROADWAY IMPACT FEE SERVICE AREAS

- City Limits
- Roadway Service Areas

## Chapter 3: Roadway Impact Fee Service Units

An important aspect of the impact fee system is the definition of an appropriate service unit to relate roadway capacity with the ability to assess new development. As defined in Chapter 395, "Service unit means a standardized measure of consumption, use, generation, or discharge attributable to an individual unit of development in accordance with generally accepted engineering or planning standards for a particular category of capital improvements or facility expansions."

To determine a roadway impact fee for a particular development, the service unit must accurately identify the impact that the development will have on the transportation system serving the development. This impact is a combination of the number of new trips generated by the development, the specific peaking characteristics of the land use(s) within the development, and the length of each new trip on the roadway system.

The service unit must also reflect the supply, which is provided by the roadway system, and the demand placed on the system during the time in which peak, or design, conditions are present on the system. Roadway facilities are designed and constructed to accommodate volumes expected to occur during the peak hours (design hours). These volumes typically occur during the morning (AM) and evening (PM) rush hours as motorists travel to and from work.

The vehicle-mile serves as the service unit for calculating and assessing roadway impact fees in Waxahachie and has been in place since 2007. The vehicle-mile as a service unit establishes a way to relate the intensity of land development to the demand on the system using published trip generation data. It also recognizes state legislation requirements with regards to trip length.

The PM peak hour was also retained as the period for assessing impacts because the greatest demand for roadway capacity occurs during this hour. Roadways are sized to meet this demand, and roadway capacity can more easily be defined on an hourly basis.

### Service Units

Service units create a link between supply (roadway projects) and demand (development). Both can be expressed as a combination of the number of vehicles traveling during the peak hour and the distance traveled by these vehicles in miles.

### Service Unit Supply

For roadway capital projects improvement, the number of service units provided during the peak hour is simply the product of the capacity of the roadway in one hour and the length of the project. For example:

Given a four-lane divided roadway project with a 600 vehicle per hour per lane capacity and a length of two miles, the number of service units provided is:

$$600 \text{ vehicles per hour per lane} \times 4 \text{ lanes} \times 2 \text{ miles} = 4,800 \text{ vehicle-miles}$$

## ROADWAY IMPACT FEE SERVICE UNITS

### Service Unit Demand

The demand placed on the system can be expressed in a similar manner. For example, a development generating 100 vehicle trips in the PM peak hour with an average trip length of two miles would generate:

$$100 \text{ vehicle-trips} \times 2 \text{ miles/trip} = 200 \text{ vehicle-miles}$$

Likewise, the existing demand placed on the roadway network is calculated in the same manner with a known traffic volume (peak hour roadway tube counts) on a street and an associated segment length.

### Service Units for New Development

An important objective in the development of the impact fee system is the development of a specific service unit equivalency for individual developments. The vehicle-miles generated by a new development are a function of the trip generation and average trip length characteristics of that development. The following describes the process used to develop the vehicle-equivalency table, which relates land use types and sizes to the resulting vehicle-miles of demand created by that development.

Travel characteristics were reviewed and deemed to be similar in nature to the previous system update, and therefore no changes were made to the resultant land use equivalency table.

### Trip Generation

Trip generation information for the PM peak hour was based on data published in the Tenth Edition of *Trip Generation* by the Institute of Transportation Engineers (ITE). *Trip Generation* is a reference publication that contains travel characteristics of over 160 land uses across the nation and is based on empirical data gathered from over 4,600 studies that were reported to the Institute by public agencies, developers and consulting firms. Data contained in this publication is generally accepted for use in studies by transportation engineers throughout the nation. Data not available was drawn from other published information. Rates were established for specific land use types within the broader categories of residential, office, commercial, industrial, and institutional land uses. Within each of the land use categories, a rate was also established for any land uses not specifically identified.

### Adjustments

The actual "traffic impact" of a specific site for impact fee purposes is based on the amount of traffic added to the street system as a result of new development. To accurately estimate new trips generated, adjustments must be made to trip generation rates and equations to account for pass-by and diverted trips. The added traffic is adjusted so that each development is assigned only for a portion of trips associated with a specific development and thus reducing the possibility of over-counting by counting only primary trips generated. Trip generation rates were reduced by percentages presented in **Table 1** to isolate the primary trip purpose.

Pass-by trips are those trips that are already on a route for a different purpose and simply stop at a development on that route. For example, a stop at a convenience store on the way home from the office is a pass-by trip for the convenience store. A pass-by trip does not create an additional burden on the street system and therefore should not be counted in the assessment of impact fees of a convenience store.

A diverted trip is a similar situation, except that a diversion is made from the regular route to make an interim stop. For example, a trip from work to home using Brown Street (from US-287) would be a

## ROADWAY IMPACT FEE SERVICE UNITS

---

diverted trip if the travel path were changed Hwy. 77 for the purpose of stopping at a retail site. On a system-wide basis, this trip places a slightly additional burden on the street system but in many cases, this burden is minimal.

**Table 1** contains the documented estimates of trip rate adjustments used in determining the appropriate rate to use in the impact fee calculation process. Adjustments were based on studies documented in the ITE trip generation manual.

The resulting trip rates based on ITE Trip Generation are illustrated as part of Table 3 Land Use/Vehicle Mile Equivalency Table illustrated later in this chapter. Rates were developed in lieu of equations to simplify the assessment of impact fees by the City and likewise, the estimation of impact fees by persons who may be required to pay an impact fee in conjunction with a development project.

### Trip Length

Trip lengths (in miles) are used in conjunction with site trip generation to estimate vehicle-miles of travel. Trip length data was based on information generated in the 1995 North Central Texas Council of Governments (NCTCOG) Workplace Survey and the National Workplace Survey. These travel characteristics were applied to Waxahachie to determine average trips lengths for common land use types.

**Table 2** summarizes the derived average trip lengths for major land use categories. These trip lengths represent the average distance that a vehicle will travel between an origin and destination of which either the origin or destination contains the land-use category identified below. Data compiled by the Workplace Survey represents the best available information on trip lengths for this area.

## ROADWAY IMPACT FEE SERVICE UNITS

---

### *Adjustments*

The assessment of an individual development's impact fee is based on the premise that each vehicle-trip has an origin and a destination and that the development end should pay for one-half of the cost necessary to complete each trip. Thus, the development is charged only for a portion of the vehicle-trip associated with that development.

To prevent double charging, and to fairly attribute the demand placed on the system to each trip end location, the trip length was adjusted to remove travel on the federal roadway system and then divided by two to reflect half of the vehicle trip to and from the development. Data from the NCTCOG travel forecast model was used to compare vehicle-miles of travel (VMT) by roadway functional class. Data revealed 49% of travel to use the federal system and thus the average trip length was reduced by this percentage to reflect localized travel on city streets (reflected in column 2). The average trip length, localized trip length, and adjustment for one-half trip length are illustrated in column 3 of Table 2. Where specific land uses were considered to exhibit different trip length characteristics than those identified in Table 3, engineering judgment was used to estimate the average trip length. Finally, as the service area structure was based on a six-mile boundary, those land uses that exhibited trip lengths greater than six miles were limited to this threshold.

### **Service Unit Equivalency Table**

The result of combining the trip generation and trip length information is an equivalency table which establishes the service unit rate for various land uses. These service unit rates are based on an appropriate development unit for each land use. For example, a dwelling unit is the basis for residential uses, while 1,000 gross square feet of floor area is the basis for office, commercial, and retail uses. Other less common land uses are based on appropriate independent variables.

Separate rates have been established for specific land uses within the broader categories of residential, commercial, industrial, and institutional to reflect the differences between land uses within the categories. However, even with these specific land use types, information is not available for every conceivable land use, so limitations do exist.

The updated equivalency table is illustrated in **Table 3**. Table 3 is reflective of adjusted trip rates (detailed in Table 1) and trip lengths (Table 2).

# ROADWAY IMPACT FEE SERVICE UNITS

## Chapter 4: Existing Conditions Analysis

Chapter 395 identifies specific requirements necessary in the capital improvements plan for impact fees. The existing conditions, including defining the existing roadway system, and analysis of the total capacity, the level of current usage, and commitments for usage of the existing roadway, are required as part of the capital improvements plan. This chapter discusses the existing conditions.

### Existing Conditions

An inventory of the collector and arterial facilities within the city limits was conducted to determine existing roadway conditions throughout Waxahachie. This analysis determines the capacity provided by the existing street system, the demand currently placed on the system, and the potential existence of deficiencies on the system. The analyses is then totaled by roadway service area. Updated data for the inventory was obtained from traffic volume counts conducted in May 2020 and field reconnaissance of current roadway sections.

The roadways were divided into segments based on volume changes, major intersections, service area boundaries, and capacity changes. For each roadway segment, the length, number of lanes, cross-section, and PM peak hour volume data were obtained. Lane capacities were assigned to each segment based on functional street classification, associated roadway lane capacities and the present number of lanes. Lane capacities used in the analysis are shown in **Table 4**.

**Table 4: Roadway Facility Vehicle-Mile Lane Capacities**

Roadway Facility	Designation	Hourly Vehicle-Mile Capacity per Lane Mile of Roadway Facility
Divided Arterial	DA	665
Divided Collector	DC	565
Undivided Arterial	UA	590
Undivided Collector	UC	510
Arterial with Two-Way Left Turn Lane	SA	665

Roadway hourly volume capacities are based on information reflecting Level-of-Service “C/D” operation, as identified in the transportation element of the Waxahachie Comprehensive Plan.

### Existing Volumes

Existing directional PM peak hour volumes were obtained from automated traffic counts conducted in May 2020 by the City. Automated traffic counts at 25 separate locations were collected on major roadways (as identified in the Thoroughfare Plan as arterial or collector status) throughout Waxahachie. To minimize the total number of counts, data was collected at locations where traffic volumes would typify link volumes on the major segments within the immediate area. For segments not counted, existing volumes were used, or estimates were developed based on data from adjoining roadway counts.

Data was compiled for roadway segments throughout the city and input into the database for use in calculations. A summary of volumes by roadway segment is included in **Appendix D** as part of the existing capital improvements database.

## Vehicle-Miles of Existing Capacity Supply

An analysis of the total capacity for each service area was performed. For each roadway segment, the existing vehicle-miles of capacity supplied were calculated using the following equation:

$$\text{Vehicle-Miles of Capacity} = \text{Link capacity per peak hour per lane} \times \text{Number of lanes} \times \text{Length of segment (miles)}$$

A summary of the current capacity available on the roadway system is shown in **Table 5**. It is important to note that the roadway capacity depicted in Table 5 is based on arterial collector class facilities system-wide (of the current roadway network) and not connected with the capacity to be added as part of the impact fee capital improvements plan. Directional calculations of capacity were performed separately. For a detailed listing of vehicle-miles of capacity by roadway segment, refer to Appendix D.

## Vehicle-Miles of Existing Demand

The level of current usage in terms of vehicle-miles was calculated for each roadway segment. The vehicle-miles of existing demand were calculated by the following equation:

$$\text{Vehicle-Miles of Demand} = \text{PM peak hour volume} \times \text{Length of segment (miles)}$$

Table 5 also lists total vehicle-miles of demand. Appendix D includes a detailed listing of vehicle-miles of demand by directional roadway segment.

## Vehicle-Miles of Existing Excess Capacity and Deficiencies

For each roadway segment, the existing vehicle-miles of excess capacity and/or deficiencies were calculated. Each direction was evaluated to determine if vehicle demands exceeded the available capacity. If demand exceeded capacity in one or both directions, the deficiency is deducted from the supply associated with the impact fee capital improvement plan. A summary of peak hour excess capacity and deficiencies are shown in **Table 6**. A detailed listing of the existing excess capacity and deficiencies by roadway segment is also located in Appendix D.

**Table 5: Peak Hour Vehicle-Miles of Existing Capacity and Demand**

Service Area	Capacity (Vehicle-Miles)	Demand (Vehicle-Miles)
1	13,066	3,636
2	24,630	15,269
3	4,083	1,419

Service Area	Excess Capacity (Vehicle-Miles)	Deficiency (Vehicle-Miles)
1	9,715	285
2	9,360	0
3	2,664	0
4	13,934	16
5	3,982	0
6	18,992	4
7	2,784	0
<b>Total</b>	<b>61,431</b>	<b>305</b>

## Chapter 5: Projected Conditions Analysis

Chapter 395 requires a description of all capital improvements or facility expansions and their costs necessitated by and attributable to new development within the service area. This chapter describes the projected growth, vehicle-miles of new demand, capital improvements program, vehicle-miles of new capacity supplied, and costs of the roadway improvements.

### Projected Growth

The projected growth for each transportation service area is represented by the increase in the number of new vehicle-miles generated over the 10-year planning period. The basis for the calculation of new demand is the population and employment projections that were prepared as part of a technical report entitled *Land Use Assumptions for Impact Fees* submitted in May 2020 and located in Appendix H. Estimates of population and employment were prepared for the years 2020 and 2030.

Population data was provided in terms of the number of dwelling units, households, and persons. Employment data is aggregated into three sectors of employees: basic, service and retail. These employment sectors serve as the typical components used in the traffic forecast modeling process. The employment grouping also correlate with the North American Industrial Classification (NAIC) system and include: basic employment (NAIC 210000-422999) generally encompasses the industrial and manufacturing uses; service employment (NAIC 520000-928199) encompasses government, office and professional uses; and retail employment (NAIC 440000-454390) generally includes commercial and retail use. **Table 7** and **Table 8** summarize ten-year population and employment projections by service area.

**Table 7: Ten-Year Population Projection by Service Area**

Roadway Service Area	2020		2030		10-Year Growth	
	Households	Population	Households	Population	Households	Population
1	630	1,714	1,040	2,829	410	1,115

**Projected Vehicle-Miles of New Demand**

Projected vehicle-miles of demand were calculated based on the growth expected to occur during the 10-year planning period and the service unit generation for each of the population and employment data components (basic, service and retail). Separate calculations were performed for each data component and were then aggregated for the service area. Vehicle-miles of demand for population growth were based on single-family residential dwelling units, and demand for employment based on the number of employees and estimates of square footage per employee. Assumptions for basic (industrial type land use), service (office type land use) and retail (commercial type land use) were estimated at 1,500, 500, and 1,000 square feet per employee, respectively.

**Land Use Equivalency for 10-Year Demand Estimate**

Service unit generation for residential and employment components were used to project ten-year demands by service area. The corresponding land use equivalencies are identified in Table 3 include: 2.78 vehicle-miles per dwelling unit for residential, 1.56 vehicle-miles per thousand square feet for industrial type activity, 1.57 vehicle miles per thousand square feet for commercial, and 3.40 vehicle-miles per thousand square feet for office type development. **Table 9** and **Appendix C** summarize the projected vehicle-miles of demand over the 10-year planning period 2020 and 2030 by service area.

Table 9: Vehicle-Miles of New Demand

## Capital Improvements Program

The impact fee CIP is aimed at facilitating long-term growth in Waxahachie and is rooted in arterial and collector class facilities identified in the City Thoroughfare Plan. The thoroughfare plan, as an element of the Comprehensive Plan also contemplates land use as defined in the Future Land Use Plan which was considered in the development of the Land Use Assumptions Report. Other considerations for the roadway CIP include:

- Recently completed projects with excess capacity available to serve growth;
- Projects currently under construction; and
- Remaining projects needed to complete the City Thoroughfare Plan.

## Full-System Approach for Roadway CIP Development

This program update incorporates a change to the contents of the roadway capital improvements plan (CIP). In prior programs, a tailored program of projects was identified from which to address growth. One limitation is that impact fee monies can only be spent on the specific contents of the impact fee CIP. Further, if new development desired to implement a thoroughfare plan road as part of their development, impact fee monies could not be used unless an amendment was made to the via a public hearing process. This 2020 update curtails the amendment issue by incorporating the full thoroughfare network into the impact fee program to both minimize required public hearing processes as well as provide greater flexibility in the use of impact fee funds towards phased improvements of the CIP.

To address potential implications with regard to the resultant cost per service unit calculations, as well as offset public angst as to the overall cost of the CIP, an analysis evaluating a preliminary traditional 10-year CIP to the Full-System was conducted. In short, the analysis revealed that based on growth defined in the Land Use Assumptions Report for the period 2020-2030, a generally similar cost per service unit between the two approaches. The key difference was that only 12% of system capacity of the Full-System was necessitated versus the 10-Year scenario which consumed 52% of the capacity of a traditionally based plan since impact fees are calculated on the *cost necessitated by new growth* in the unit cost calculation. **Appendix J** contains a summary and comparison of the 10-year and Full-System resultant cost per service unit. Based on the benefits of greater flexibility in the use of impact fees offered in the Full-System approach, the CIAC recommended approval of this impact CIP approach.

## Evaluation of the 2015 Impact Fee CIP

At the outset of the update process, capacity of the 2015 CIP program was evaluated to ensure that excess capacity remained in previously approved impact fee projects. Chapter 395 mandates that only CIP projects with excess capacity are eligible for consideration. Traffic volume count data collected at locations throughout the city was used in this evaluation. The analysis revealed all previously identified CIP to contain excess capacity and therefore can be retained in the program. These projects, in conjunction with newly identified roadway projects will form the basis for the Full-System CIP.

## Full-System CIP Projects

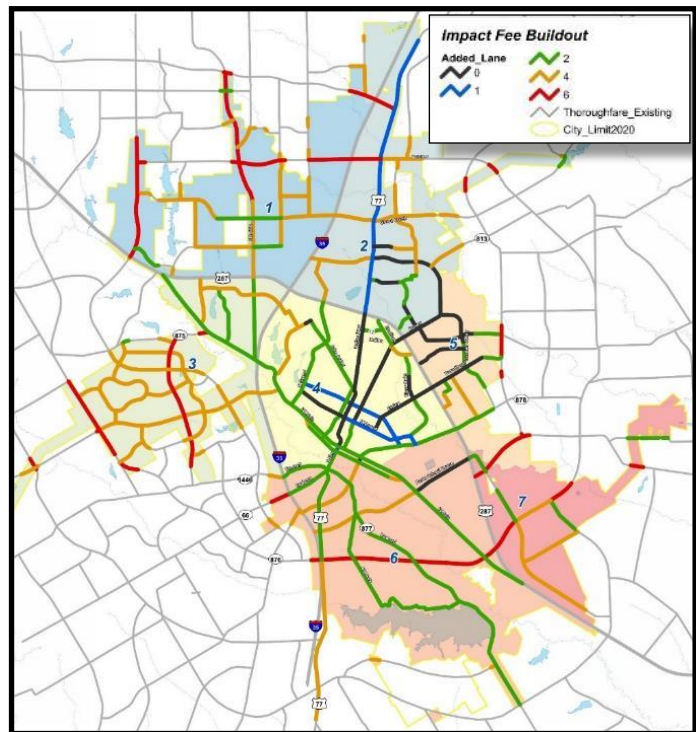

The Full-System CIP spans citywide incorporating all arterial and collector class facilities per the Thoroughfare Plan. For impact fee purposes, only new capacity, or lane additions to achieve thoroughfare standard is identified in the CIP. For example, a current two-lane roadway that is identified on the

## PROJECTED CONDITIONS ANALYSIS

Thoroughfare Plan as an ultimate six-lane, only four lanes of new capacity are considered as part of the program. Depicted at right is a graphical summary of the number of lanes needed to achieve full thoroughfare standard.

### Eligible CIP Costs

The general, those costs associated with the design, right-of-way acquisition, and construction and financing of all items necessary to implement the roadway projects identified in the capital improvement plan are eligible. These estimates are based on roadway sections identified in the City Thoroughfare Plan. It is important to note that upon completion of the capital improvements identified in the CIP, the city must recalculate the impact fee using the *actual* costs. Chapter 395.012 identifies roadway costs eligible for impact fee recovery. The law states that:

“An impact fee may be imposed only to pay the cost of constructing capital improvements for facility expansions, including and limited to the construction contract price, surveying and engineering fees, land acquisition costs, including land purchases, court awards and costs, attorney fees, and expert witness fees; and fees actually paid or contracted to be paid to an independent qualified engineer or financial consultant preparing or updating the capital improvement plan who is not an employee of the political subdivision.”

“Projected interest charges and other finance costs may be included in determining the amount of impact fees only if the impact fees are used for the payment of principal and interest on bonds, notes, or other obligations issued by or on behalf of the political subdivision to finance the capital improvements or facility expansions identified in the capital improvement plan and are not used to reimburse bond funds expended for facilities that are not identified in the capital improvement plan.”

The following details the individual cost components of the impact fee CIP.

**Construction:** Unit cost estimates for application on a linear foot basis was prepared for each functional class of street identified in the Thoroughfare Plan. Unit cost estimates based on recent area bid tabs of other recently constructed facilities were used as a basis for individual components to facility construction. Other sources of unit pricing included TxDOT 12-Month Averages, and other recently prepared estimates by Freese and Nichols. Items included in the unit costing are standard appurtenances to implement each roadway class type. Other items included in cost estimates included: sidewalks, traffic control devices at select locations (initial cost only), and minimal sodding/landscaping.

## PROJECTED CONDITIONS ANALYSIS

---

Engineering: These are the costs associated with the design and surveying necessary to construct the roadway. Because the law specifically references fees, it has generally been understood that in-house City design and surveying cannot be included. Only those services that are contracted out can be included and it may be necessary to use outside design and surveying firms to perform the work. For planned projects, a percentage based on typical engineering contracts was used to estimate these fees and was assumed to be 7%.

Right-of-Way: Any land acquisition cost estimated to be necessary to construct a roadway can be included in the cost estimate. For planning purposes, only 20 feet of additional land was assumed to be needed to achieve thoroughfare standard. This approach was aimed at being conservative. The cost for right-of-way may vary based on location of project and was assumed to be \$0.50 per square foot.

Debt Service: Predicted interest charges and finance costs may be included in determining the amount of impact fees only if the impact fees are used for the payment of principle and interest on bonds, notes, or other obligations issued by the city to finance capital improvements identified in the impact fee CIP. They cannot be used to reimburse bond funds for other facilities. Debt service was assumed to be 4% of total project cost and compounded over a 20-year period.

Study Updates: The fees paid or contracted to be paid to an independent qualified engineer or financial consultant preparing or updating the capital improvement plan who is not an employee of the political subdivision can be included in the impact fees. Two five-year updates at \$50,000 were incorporated into the CIP.

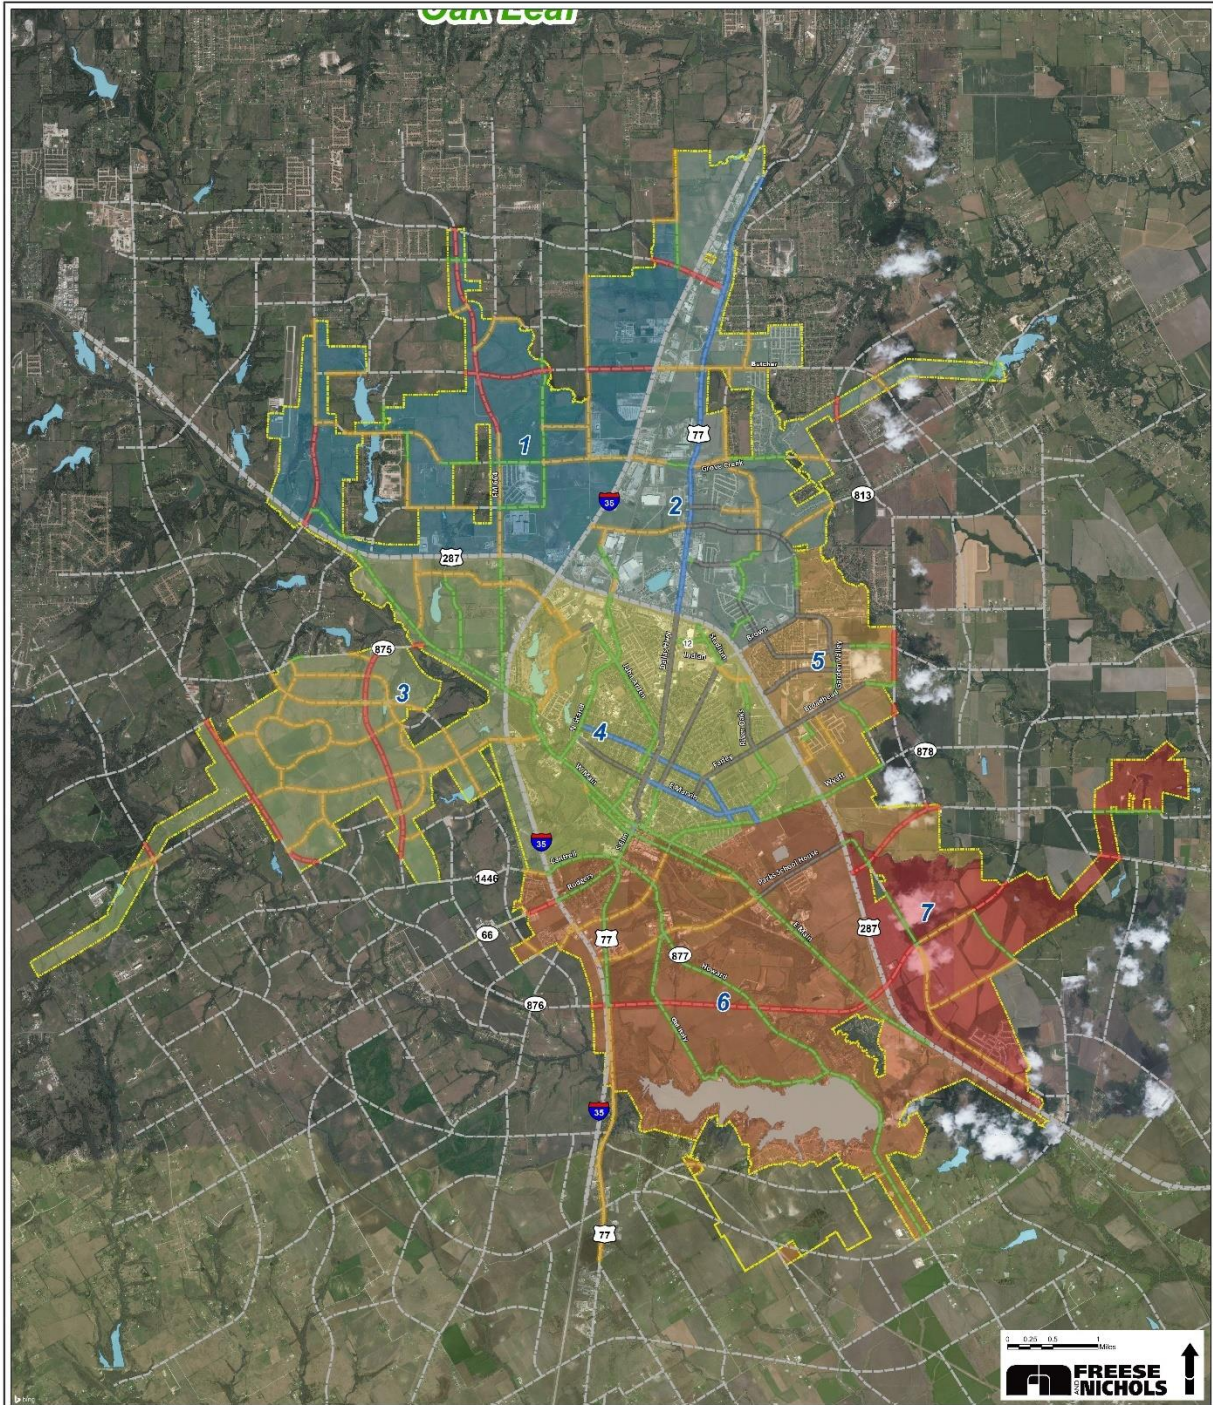

The Full-System CIP consists of 242 project segments spanning the roadway service areas and are illustrated in **Figure 2**. Project costs were broken into general categories of construction, engineering, right-of-way, and debt service are detailed in **Appendix E**. The cost of the Full-System CIP totals \$642M.

State legislation requires that a credit for the portion of ad-valorem tax revenues generated by improvements over the program period, or a credit equal to 50% of the total projected cost of implementing a roadway impact fee capital improvements program be given. Based on a 50% credit, the cost that can be initially considered in the impact fee program is \$321M. Impact fee law stipulates that only the cost attributable to new growth can be considered in the cost per service unit calculation. Based on the approved Land Use Assumptions, about 12% of capacity was necessitated and only \$35M of this CIP can be considered for impact fees at this time. (The cost of excess capacity is not lost but is used as necessitated by future growth in the next program update – in at least, five years). The recommended Full-System CIP program will provide 275,497 vehicle-miles of new net capacity.

Figure 2: Roadway Impact Fee Capital Improvement

**Roadway Impact Fee Program  
CIP Projects  
Thoroughfare Plan Buildout**

**Impact Fee Buildout**

- |             |   |                   |
|-------------|---|-------------------|
| Added Lanes | 2 | Thoroughfare Plan |
| 0           | 4 | City Limit        |
| 1           | 6 |                   |

**Projected Vehicle-Miles Capacity Available for New Growth**

The vehicle-miles of new capacity supply were calculated similar to the vehicle-miles of existing capacity supplied. The equation used was:

$$\text{Vehicle-Miles of New Capacity Supplied} = \text{Link capacity per peak hour per lane} \times \text{Num. of lanes within Service Area} \times \text{Length of segment (miles)}$$

Vehicle-miles of new supply provided by the CIP are listed in **Table 10**. While the project has not been built, there are system deficiencies (by service area) that have been removed from the total supply to properly account for new “net” availability. Table 9 depicts net availability of supply by the CIP. **Appendix E** details capacity calculations provided by the CIP program.

**Table 10: Vehicle-Miles of New Capacity Supplied**

Service Area	Vehicle-Miles of New Capacity Supplied	Vehicle-Miles of Net New Capacity Supplied
1	52,102	51,817
2	35,273	35,273
3	67,211	67,211
4	25,508	25,492
5	16,169	16,169
6	61,024	61,020
7	18,515	18,515
<b>Total</b>	<b>275,802</b>	<b>275,497</b>

**Cost of Roadway Improvements**

The total and net cost to implement the roadway improvements plan projects by service area is shown in **Table 11**. If traffic exists on proposed CIP project roadways or there are any deficiencies present in each respective service area, the total system cost is adjusted to reflect the net capacity being made available by the impact fee program. In other words, only the unused portion of the CIP and its associated costs are considered eligible. A detailed listing of cost by project segment in each service area can be found in **Appendix F**. **Appendix G** details system costs by service area.

Table 11: Summary of Roadway Improvements Plan Cost Analysis

Service Area	Actual Cost of Proposed Impact Fee Program	Adjusted Cost (50% Credit) of Proposed Impact Fee Program
1	\$114,134,639	\$57,067,320
2	\$79,767,179	\$39,883,590
3	\$181,270,721	\$90,635,361
4	\$60,889,012	\$30,444,506
5	\$39,487,440	\$19,743,720
6	\$112,653,809	\$56,326,905
7	\$54,189,439	\$27,094,719
<b>Total</b>	<b>\$642,392,240</b>	<b>\$321,196,120</b>

State law is specific in identifying that only the portion of the CIP necessitated and attributable to new development is eligible for cost recovery. For example, if only 60% of the net service units supplied by the CIP are needed in the next 10 years, only 60% of the cost (credited at 50% per legislative requirements) may be considered in the calculation of fees. The Full-System CIP contains plenty of capacity to address future growth over the 10-year planning period. The cost attributable to new growth is \$35.7 million and represents the citywide cost to implement projects on the impact fee program. **Table 12** depicts CIP costs attributable to new growth by service area.

Table 12: Capital Improvements Plan Costs Attributable to New Development

Service Area	Adjusted Cost (50% Credit) of Net New Capacity	Adjusted Cost (50% Credit) Attributable to New Growth
1	\$56,755,159	\$4,472,110
2	\$39,883,590	\$11,848,727
3	\$90,635,361	\$3,442,771
4	\$30,425,410	\$4,127,219
5	\$19,743,720	\$2,985,552
6	\$56,323,213	\$7,614,987
7	\$27,094,719	\$1,186,812
<b>Total</b>	<b>\$320,861,171</b>	<b>\$35,678,177</b>

## Chapter 6: Calculation of Impact Fees

This chapter discusses the calculation of the cost per service unit and the calculation of roadway impact fees. The transportation impact fee will vary by the land use, service area, and size of the development. Examples are included to better illustrate the method by which the transportation impact fees are calculated.

### Cost Per Service Unit

The cost per service unit is calculated by dividing the cost of the CIP necessitated and attributable to new demand (net cost) by the projected service units of growth over the 10-year planning period.

Generally, the cost per service unit varies by service area because of variations in cost of CIP, projected growth and the number of service units necessitated by new growth between zones. Where net capacity supplied is greater than demand, the cost per service unit is simply the cost of the net capacity divided by the number of service units provided. In this case, only the portion of the CIP necessitated by new development is used in the calculation. If the net capacity supplied is *less* than projected new demand, then the cost per service unit is calculated by dividing the total cost of net supply by the portion of new demand attributable and necessary by development. The result is generally a decrease in the cost per service unit, because such cost is spread over the larger number of service units of growth.

**Table 13** lists the results of the cost per service unit calculation by service area. The actual cost per service unit reflects the true burden to the City for the implementation of the roadway capital improvements program. As per state law, a credit for the portion of ad-valorem tax revenues generated by improvements over the program period, or a credit equal to 50% of the total projected cost of implementing the capital improvements plan must be given. Based on this analysis, the maximum collection rate reflects the maximum amount per service unit that can be charged to follow the state statute. **Appendix G** details the maximum fee per service unit calculation for each service area.

**Table 13: Cost Per Service Unit Summary**

Service Area	Actual Cost Per Service Unit	Maximum Fee per Service Unit (50% Credit)
1	\$2,190.00	\$1,095.00
2	\$2,260.00	\$1,130.00
3	\$2,696.00	\$1,348.00
4	\$2,386.00	\$1,193.00
5	\$2,442.00	\$1,221.00
6	\$1,846.00	\$923.00
7	\$2,926.00	\$1,463.00
<b>Average</b>	<b>\$2,328.00</b>	<b>\$1,164.00</b>

# CALCULATION OF IMPACT FEES

## Calculation of Roadway Impact Fees

The calculation of roadway impact fees for new development involves a two-step process. Step one is the calculation of the total number of service units that will be generated by the development. Step two is the calculation of the impact fee due by the new development.

*Step 1:* Determine number of service units (vehicle-miles) generated by the development using the equivalency table.

$$\begin{array}{rcccl} \text{No. of Development} & & \times & \text{Vehicle-miles} & = & \text{Development's} \\ \text{Units} & & & \text{per development unit} & & \text{Vehicle-miles} \end{array}$$

*Step 2:* Calculate the impact fee based on the fee per service unit for the service area where the development is located.

$$\begin{array}{rcccl} \text{Development's} & \times & \text{Fee per} & & = & \text{Impact Fee due} \\ \text{Vehicle-miles} & & \text{vehicle-mile} & & & \text{from Development} \end{array}$$

**Examples: The following fees would be assessed to new developments in Service Area 2 if the cost per service unit were \$1014.00.**

### Single-Family Dwelling

$$\begin{array}{l} 1 \text{ dwelling unit} \times 2.78 \text{ vehicle-miles/dwelling unit} = 2.78 \text{ vehicle-miles} \\ 2.78 \text{ vehicle-miles} \times \$1,014.00 \text{ /vehicle-mile} = \$2,818.92 \end{array}$$

### 20,000 square foot (s.f.) Office Building

$$\begin{array}{l} 20 (1,000 \text{ s.f. units}) \times 3.40 \text{ vehicle-miles/1,000 s.f. units} = 68.00 \text{ vehicle-miles} \\ 68.00 \text{ vehicle-miles} \times \$1,014.00 \text{ /vehicle-mile} = \$68,952.00 \end{array}$$

### 100,000 s.f. Retail Center

$$\begin{array}{l} 100 (1,000 \text{ s.f. units}) \times 1.57 \text{ vehicle-miles/1,000 s.f. units} = 157.00 \text{ vehicle-miles} \\ 157.00 \text{ vehicle-miles} \times \$1,104.00 \text{ /vehicle-mile} = 159,198.00 \end{array}$$

### 200,000 s.f. Industrial Development

$$\begin{array}{l} 200 (1,000 \text{ s.f. units}) \times 1.56 \text{ vehicle-miles/1,000 s.f. units} = 312.00 \text{ vehicle-miles} \\ 312.00 \text{ vehicle-miles} \times \$1,014.00 \text{ /vehicle-mile} = \$316,368.00. \end{array}$$

### Chapter 7: Conclusions

In Texas, Chapter 395 contains technical and administrative requirements for the implementation and update of impact fee programs in the state. By law, the impact fee program must be reviewed at least every five years. This program update serves to satisfy those legislative requirements. Waxahachie first adopted roadway impact fees in 2008, and subsequently updated the program in 2012 and in 2015. Since its inception, roadway impact fees have helped to fund numerous projects citywide as a means towards keeping pace with growth and development. In each program update, the roadway capital improvements plan was amended to incorporate additional projects to address growth throughout the city.

In Waxahachie, seven service areas were established at the outset of the program in 2008. In this update, those service areas are retained but have been amended to address changes in corporate limits due to annexation since the 2015 update. Slight adjustments were made to Service Areas 1, 2, 5, and 6 and each were reviewed to ensure that no point is greater than the six-mile maximum set forth by law. The six-mile limit ensures that roadway improvements are near where new development is occurring.

The vehicle-mile of travel in the PM peak hour was retained as the service unit for calculating and assessing roadway impact fees. This service unit establishes an appropriate relationship between the intensity of land development and the demand on the roadway system using published travel characteristics (trip generation and average trip length) of specific land use types. The PM peak hour is typically used as the design hour for roads as this period receives the greatest demand for roadway capacity during the day. Additionally, roadways are sized to meet this demand and roadway capacity can more accurately be defined on an hourly basis.

Service unit generation (vehicle-miles) for new development is a function of trip generation and the average trip length for specific land uses and detailed in the Land Use Equivalency table. Trip generation information was amended to incorporate updated data published in Trip Generation, 10<sup>th</sup> Edition by the Institute of Transportation Engineers in March 2018 and amended in September 2020. Where appropriate, trip generation rates were adjusted to reflect the primary trip purpose (pass-by and diverted trips netted out based on published documentation). This ensures that new development is assigned for only the portion of trips associated with that specific development. Average trip length data was based on information compiled by NCTCOG as part of the Mobility 2040 regional travel demand model, data from a NCTCOG Workplace Survey, statistics from the US Census Bureau National Workplace Survey, and tailored to Waxahachie. The result of combining updated trip generation and trip length information is an amended equivalency table that establishes service unit generation by specific land use types. Land use equivalencies were amended for specific land uses within the broader categories of residential, office, commercial, industrial, and institutional uses.

An analysis of existing conditions revealed that the current full roadway system provides over 101,051 vehicle-miles of capacity. The existing demand placed on the system was determined to be 39,924 vehicle-miles. Evaluation of the existing roadway system found 305 vehicle-miles of deficiencies on the existing roadway network.

Projected growth, in terms of vehicle-miles over the 10-year planning period, was based on population and employment data that was prepared in the Land Use Assumptions for Impact Fees Final Report dated

May 2020 by Freese and Nichols, Inc. Based on forecasted growth, which considers a compound annual growth rate of 3.5%, the projected vehicle-miles of demand calculated to be 32,079 over the ten-year planning period 2020-2030.

This program update incorporates a philosophical change to the contents of the roadway capital improvements plan (CIP). In prior programs, a tailored program of projects was identified from which to address growth. One limitation is that impact fee monies can only be spent on the specific contents of the impact fee CIP. If new development were to implement improvements outside of the impact fee CIP, no credit could be given, nor impact fee monies enabled without an amendment to the CIP via a public hearing process.

This 2020 update curtails this issue by incorporating the full thoroughfare network into the impact fee program to both minimize the impact FEE CIP amendment process as well as enable the ability to credit new development for off-site roadway project improvements. In essence, this approach enables further flexibility in the use of impact fee funds towards phased improvements, as appropriate, throughout the city's major street network. While at first glance it may seem like a drastic departure from an overall cost perspective, the unit cost to provide service is generally about the same. An analysis of the prepared 10-Year CIP relative to the Full System approach yielded a generally similar cost per service unit between the two approaches. The key difference was that only 12% of system capacity was necessitated by ten-year growth rather than 52% of the traditional program. Since impact fees are calculated on the *cost necessitated by new growth*, and a generally similar cost per service unit calculated, the benefits of greater flexibility in the use of impact fees justified the shift in philosophical approach.

The developed Full-System roadway impact fee CIP spans citywide capturing strictly new capacity or lane additions for arterial and collector class facilities identified on the official City Thoroughfare Plan. For example, a current two-lane roadway that is identified on the Thoroughfare Plan as an ultimate six-lane, only four lanes of new capacity are considered in the program. The Full-System CIP consists of 242 project segments totaling \$642M. State legislation requires that a credit for the portion of ad-valorem tax revenues generated by improvements over the program period, or a credit equal to 50% of the total projected cost of implementing a roadway impact fee capital improvements program be given. Based on a 50% credit, the cost that can be initially considered in the impact fee program is \$321M. Impact fee law stipulates that only the cost attributable to new growth can be considered in the cost per service unit calculation. Based on the approved Land Use Assumptions, about 12% of capacity was necessitated and only \$35.7M of this CIP can be considered for impact fees at this time. (The cost of excess capacity is not lost but is used as necessitated by future growth in the next program update – in at least, five years). The recommended Full-System CIP program will provide 275,497 vehicle-miles of new net capacity.

Based on the cost necessitated by growth over the ten-year planning period, the calculated credited cost per service unit ranged from \$923.00 and \$1,463.00 within the seven service areas spanning the city. The *actual* cost per service unit was calculated to be between \$1846.00 and \$2,926.00. The difference reflects the burden that the city tax base will pick up over time.

The determination of impact fee due from new development is based upon the size, type and intensity of development, its associated service unit generation (determined through use of the equivalency table), and the cost per service unit adopted for collection within each roadway service area.

## APPENDICES

---

Work prepared as part of this program update, was formally reviewed, and commented on by the Waxahachie Capital Improvements Advisory Committee (CIAC). In addition to reviewing material with City Staff, meetings with the CIAC were held between February and October 2020 to discuss; 1) city growth rates and Land Use Assumptions, preliminary and final capital improvements plans (CIP) and associated project costing, and the resultant derived cost per service unit calculations. Recommendations for amendments to collection rates were also discussed and forwarded to the Waxahachie City Council. The program update was also presented in Workshop to the City Council in October 2020.

Per administrative requirements defined in Chapter 395, Texas Local Government Code, appropriate notifications through Council resolutions, public noticing, and posted agenda were prepared culminating in a public hearing in December 2020 to consider update to Land Use Assumptions, Capital Improvement Plans, and Impact Fees for the roadway program in Waxahachie.

# APPENDICES

## Appendix A: Roadway Impact Fee Definitions

### ROADWAY IMPACT FEE DEFINITIONS

**Average Trip Length** - the average actual travel distance between two points. The average trip length by specific land use varies.

**Diverted Trip** - similar to pass-by trip, but a diversion is made from the regular route to make an interim stop.

**Impact Fee** - a charge or assessment imposed by a city against new development to generate revenue for funding or recouping roadway improvements necessitated and attributable to new development.

**Land Use Equivalency** – correlation of a land use to the rate of vehicle miles CIP of network capacity it would consume

**Maximum Fee Per Service Unit** - the highest impact fee that may be collected by the City per vehicle-mile of supply. Calculated by dividing the costs of the capital improvements by the total number of vehicle-miles of demand expected in the 10-year planning period.

**Pass-by Trip** - a trip made as an intermediate stop on the way from an origin to a primary trip destination. For example, a stop at a convenience store on the way to office from home.

**PM Peak Hour** - the hour when the highest volume of traffic typically occurs. Data collection (May 2019) revealed the peak hour of travel between 5:00 and 6:00 pm for Waxahachie.

**PM Peak Hour Traffic Counts** - the number of vehicles passing a certain point during the peak hours of travel. Traffic counts are conducted during the PM peak hour because the greatest demand for roadway capacity occurs during this hour.

**Primary Trip** - a trip made for the specific purpose of visiting a destination, for example, from home to office.

**Roadway Demand** - the demand placed on the roadway network because of development. Determined by multiplying the trip generation of a specific land use by the average trip length.

**Roadway Supply (or Capacity)** - the number of service units provided by a segment of roadway over a period. Determined by multiplying the lane capacity by the roadway length.

**Service Area** - the area within the city boundaries to be served by capital improvements. Criteria for developing the service area structure include; 1) restricted to six-mile limit by legislation (to ensure proximity of roadway improvements to development), 2) conforms to census or forecast model boundaries, 3) projects on CIP as boundaries, 4) effort to match roadway supply with projected demand, or 5) city limit boundaries.

## APPENDICES

---

**Service Unit** - a measure of use or generation attributable to new development for roadway improvements. Also used to measure supply provided by existing and proposed roadway improvements.

**Trip** - a single, one-direction vehicle movement from an origin to a destination.

**Trip Generation** - the total trip ends for a land use over a given period or the total of all trips entering and exiting a site during that designated time. Used in the development of the land use equivalency table for Waxahachie. Based primarily on data prepared by the Institute of Transportation Engineers (ITE).

**Vehicle** - for impact fee purposes, any motorized appurtenance that carries passengers and/or goods on the roadway system during peak periods of travel.

**Vehicle-mile** - a unit used to express both supply and demand provided by, and placed on, the roadway system. A combination of a number of vehicles traveling during a given period and the distance in which these vehicles travel in miles.

## Appendix B: Land Use Definitions

## LAND USE DEFINITIONS Waxahachie Roadway Impact Fee Land Use Equivalencies

Land uses for the roadway impact fee service unit equivalency table have been grouped into the major categories of residential, office, commercial, industrial, and institutional uses. The following is a listing of land uses that apply within each category. The City Engineer's best judgment should be used for any land uses not specified herein.

### ***Residential***

Single-Family Detached - Any single-family detached home affixed to its foundation on an individual lot is included in this category. A range of density is associated with this land use and may be located in both suburban, rural, and urban locations. A typical example of this land use is a home in a residential subdivision.

Apartment - This land use includes both low-rise ("walk-up" dwellings) and high-rise multi-family apartments. An apartment is defined as a dwelling unit that is located within the same building with three or more dwelling units. Also included in this land use are triplex and quadplex units.

Residential Condominium / Townhouse – Residential condominiums and townhomes are defined as single-family units that have at least one other single-family unit within the same building structure.

Senior Adult Housing - Detached - Senior adult housing consists of detached independent living developments, including retirement communities, age-restricted housing, and active adult communities. These developments may include amenities such as golf courses, swimming pools, 24-hour security, transportation, and common recreational facilities. However, they generally lack centralized dining and on-site health facilities. Detached senior adult housing communities may or may not be gated. Residents in these communities are typically active (requiring little to no medical supervision). The percentage of retired residents varies by development.

Assisted Living – An assisted living complex is a residential setting that provides either routine general protective oversight or assistance with activities necessary for independent living to mentally or physically limited persons. It commonly has separate living quarters for residents. Its services typically include dining, housekeeping, social and physical activities, medication administration, and transportation. Alzheimer's and ALS care are commonly offered by these facilities, though the living quarters for these patients may be located separately from the other residents. Assisted care commonly bridges the gap between independent living and nursing homes. In some areas of the country, assisted living residences may be called personal care, residential care, or domiciliary care. Staff may be available at an assisted care facility 24 hours a day, but skilled medical care—which is limited in nature—is not required.

Continuing Care Retirement Community - A continuing care retirement community (CCRC) is a land use that provides multiple elements of senior adult living. CCRCs combine aspects of independent living with increased care, as lifestyle needs change with time. Housing options may include various combinations of senior adult (detached), senior adult (attached), congregate care, assisted living, and skilled nursing care—aimed at allowing the residents to live in one community as their medical

needs change. The communities may also contain special services such as medical, dining, recreational, and some limited, supporting retail facilities. CCRCs are usually self-contained villages.

### **Office**

General Office Building - A general office building houses one or more tenants and is the location where affairs of a business are conducted. The building or buildings may be limited to one tenant, either the owner or lessee, or contain a mixture of tenants including professional services, insurance companies, investment brokers, company headquarters, and services for the tenants such as a bank or savings and loan, a restaurant or cafeteria, and service retail facilities. Also included in this category are other office uses not specified above.

Corporate Headquarters Building - A building that houses corporate headquarters of a company or organization and consists of offices, meeting rooms, space for storage and data processing, a cafeteria and other service functions. Such buildings typically house a single tenant although some sub-area space may be leased out.

Medical-Dental Office - A medical office building is a facility that provides diagnosis and outpatient care, but which is unable to provide prolonged in-house medical/surgical care. One or more private physicians generally operate this type of building. Also included in this category are dental facilities with one or more private dentists.

U.S. Post Office – A United States post office is a federal building that contains service windows for mailing packages and letters, post office boxes, offices, sorting and distributing facilities for mail, and vehicle storage areas.

Research and Development Center - A research and development center are a facility or group of facilities devoted almost exclusively to research and development activities. The range of specific types of businesses contained in this land use category varies significantly. Research and development centers may contain offices and light fabrication areas.

Business Park - Business parks consist of a group of one or multi-story buildings served by a common roadway system similar to an office or industrial park. The tenant space is flexible to house a variety of uses. Tenants may be start-up companies or fully matured relatively small companies that require a variety of space. Offices, retail and wholesale sales, restaurants, and recreation, as well as warehousing, manufacturing, light industrial, and scientific research uses are typical within this land use. Other similar uses include research and development centers, office parks, corporate headquarter buildings, single-tenant buildings and other uses not specified above.

For land uses not specified within this category, the General Office land use shall serve as a default use. The City Engineer shall make the final determination for a specific use in calculating impact fees.

### **Commercial**

Hotel – A hotel is a place of lodging that provides sleeping accommodations and supporting facilities such as restaurants, cocktail lounges, meeting and banquet rooms or convention facilities, limited recreational facilities (pool, fitness room), and/or other retail and service shops.

All Suites Hotel – An all-suites hotel is a place of lodging that provides sleeping accommodations, a small restaurant and lounge, and small amounts of meeting space. Each suite includes a sitting room and separate bedroom; limited kitchen facilities are provided within the suite.

Motel – A motel is a place of lodging that provides sleeping accommodations and often a restaurant. Motels generally offer free on-site parking and provide little or no meeting space and few (if any) supporting facilities. Exterior corridors accessing rooms—immediately adjacent to a parking lot—commonly characterize motels.

Movie Theater with Matinee - This land use consists of a movie or live theater and contains audience seating, single or multiple auditoriums, lobby, offices, and refreshment stands. Operational hours may vary but generally include movie showings from early afternoon through the evening hours. Matinee events may also begin as early as noon.

Health Fitness – This

Shopping Center - A shopping center is an integrated group of commercial establishments that is planned, developed, owned, and managed as a unit. A shopping center's composition is related to its market area in terms of size, location, and type of store. A shopping center also provides on-site parking facilities sufficient to serve its own parking demands.

Building Materials and Lumber Store – A building materials and lumber store is a free-standing building that sells hardware, building materials, and lumber. The lumber may be stored in the main building, yard, or storage shed.

Hardware/Paint Store – A hardware/paint store is a free-standing building that sells hardware and paint supplies.

Garden Center (Nursery) – A nursery or garden center is a free-standing building with an outside storage area for planting or landscape stock. The nurseries surveyed primarily serve the general public. Some have large greenhouses and offer landscaping services. Most have office, storage, and shipping facilities. Nurseries are characterized by seasonal variations in trip characteristics.

Nursery (Wholesale) – A wholesale nursery is a free-standing building with an outside storage area for planting or landscape stock. The nurseries surveyed primarily serve contractors and suppliers. Some have large greenhouses and offer landscaping services. Most have office, storage, and shipping facilities. Nurseries are characterized by seasonal variations in trip characteristics.

Automobile Sales (New) – An automobile sales dealership is typically located along a major corridor characterized by commercial development. The sale or leasing of new or used cars is the primary business at these facilities; however, automobile services and parts sales may also be available. Some dealerships also include leasing options, truck sales, and servicing.

Automobile Sales (Used) – Auto dealership typically with pre-owned vehicles. These dealerships are generally smaller in nature than new auto dealerships. This land use may not contain formalized maintenance or servicing facilities.

Auto Parts Sales – An automobile parts sales facility specializes in the sale of automobile parts for maintenance and repair. Items sold at these facilities include spark plugs, oil, batteries, and a wide range of automobile parts. These facilities are not equipped for on-site vehicle repair.

Tire Store – The primary business associated with a tire store is the sale and marketing of tires for automotive vehicles. Services offered by these stores usually include tire installation and repair, as well as other automotive maintenance or repair services and customer assistance. These stores generally do not contain large storage or warehouse areas.

Supermarket – A supermarket is a free-standing retail store selling a complete assortment of food, food preparation and wrapping materials, and household cleaning items. Supermarkets may also contain the following products and services: ATMs, automobile supplies, bakeries, books and magazines, dry cleaning, floral arrangements, greeting cards, limited-service banks, photo centers, pharmacies, and video rental areas. Some facilities may be open 24 hours a day.

Convenience Market with Gasoline Pumps – This land use includes convenience markets with gasoline pumps where the primary business is the selling of convenience items, not the fueling of motor vehicles. The sites included in this land use category have the following two specific characteristics:

- The gross floor area of the convenience market is at least 2,000 gross square feet
- The number of vehicle fueling positions is less than 10

Discount Club – A discount club is a discount store or warehouse where shoppers pay a membership fee in order to take advantage of discounted prices on a wide variety of items such as food, clothing, tires, and appliances; many items are sold in large quantities or bulk. Some sites may include on-site fueling pumps.

Home Improvement Superstore – A home improvement superstore is a free-standing facility that specializes in the sale of home improvement merchandise. These stores generally offer a variety of customer services and centralized cashiering. Home improvement superstores typically maintain long store hours 7 days a week. Examples of items sold in these stores include lumber, tools, paint, lighting, wallpaper and paneling, kitchen and bathroom fixtures, lawn equipment, and plant and garden accessories. The stores included in this land use are often the only ones on the site, but they can also be found in mutual operation with a related or unrelated garden center. Home improvement superstores are sometimes found as separate parcels within a retail complex, with or without their own dedicated parking. The buildings contained in this land use usually range in size from 50,000 to 200,000 square feet gross floor area. This land use does not include interior design stores.

Electronic Superstore – An electronics superstore is a free-standing facility that specializes in the sale of electronic merchandise. These facilities generally offer a variety of customer services and centralized cashiering. Electronics superstores typically maintain long store hours 7 days a week. Examples of items sold in these stores include televisions, audio and video players and recorders, software, telephones, computers, and general electronic accessories. Major home appliances may also be sold at these facilities. Electronics superstores are sometimes found as separate parcels within a retail complex, with or without their own dedicated parking.

Apparel Store – An apparel store is an individual store specializing in the sale of clothing.

Pharmacy with Drive Thru – A pharmacy/drugstore is a retail facility that primarily sells prescription and non-prescription drugs. These facilities may also sell cosmetics, toiletries, medications, stationery, personal care products, limited food products, and general merchandise. The drug stores in this category contain drive-through windows.

Furniture Store – A furniture store is a full-service retail facility that specializes in the sale of furniture and often carpeting. Furniture stores are generally large and may include storage areas. The sites surveyed included both traditional retail furniture stores and warehouse stores with showrooms. Although some home accessories may be sold, furniture stores primarily focus on the sale of pre-assembled furniture. A majority of items sold at these facilities must be ordered for delivery.

Bank with Drive Thru – A bank with drive-thru provides banking facilities for motorists who conduct financial transactions from their vehicles; many also serve patrons who walk into the building. The drive-in lanes may or may not provide automatic teller machines (ATMs).

Quality Restaurant – This land use consists of high quality, full-service eating establishments with a typical duration of stay of at least one hour. Quality restaurants generally do not serve breakfast; some do not serve lunch; all serve dinner. This type of restaurant often requests and sometimes requires reservations and is generally not part of a chain. Patrons commonly wait to be seated, are served by a waiter/waitress, order from menus and pay for meals after they eat. While some of the study sites have lounge or bar facilities (serving alcoholic beverages), they are ancillary to the restaurant.

High-Turnover (Sit-Down) Restaurant – This land use consists of sit-down, full-service eating establishments with typical duration of stay of approximately one hour. This type of restaurant is usually moderately priced and frequently belongs to a restaurant chain. Generally, these restaurants serve lunch and dinner; they may also be open for breakfast and are sometimes open 24 hours a day. These restaurants typically do not take reservations. Patrons commonly wait to be seated, are served by a waiter/waitress, order from menus and pay for their meal after they eat. Some facilities contained within this land use may also contain a bar area for serving food and alcoholic drinks.

Fast food with Drive Thru – This category includes fast-food restaurants with drive-through windows. This type of restaurant is characterized by a large drive-through clientele, long hours of service (some are open for breakfast, all are open for lunch and dinner, some are open late at night or 24 hours a day) and high turnover rates for eat-in customers. These limited service eating establishments do not provide table service. Non-drive-through patrons generally order at a cash register and pay before they eat.

Quick Lubrication Vehicle Stop – A quick lubrication vehicle shop is a business where the primary activity is to perform oil change services for vehicles. Other ancillary services provided may include preventative maintenance, such as fluid and filter changes. Automobile repair service is generally not provided.

Automotive Care Center – An automobile care center houses numerous business that provide automobile-related services, such as repair and servicing, stereo installation, and seat cover upholstery.

Gas/Service Station with Convenience Market – This land use includes gasoline/service stations with convenience markets where the primary business is the fueling of motor vehicles. These service stations may also have ancillary facilities for servicing and repairing motor vehicles and may have a car wash. Some commonly sold convenience items are newspapers, coffee or other beverages, and snack items that are usually consumed in the car. The sites included in this land use category have the following two specific characteristics:

- The gross floor area of the convenience market is between 2,000 and 3,000 gross square feet
- The number of vehicle fueling positions is at least 10

### ***Industrial***

General Light Industrial - Light industrial facilities usually employ fewer than 500 persons and have an emphasis on activities other than manufacturing. Typical light industrial activities include printing plants, material testing laboratories, assemblers of data processing equipment, power stations and warehousing of less than 35,000 square feet; most facilities are freestanding and devoted to a single use.

Industrial Park - Industrial parks are areas containing a number of industrial or related facilities. They are characterized by a mix of manufacturing, service, and warehouse facilities with a wide variation in the proportion of each type of use from one location to another. Many industrial parks contain highly diversified facilities - some with a large number of small businesses and others with one or two dominant industries.

Manufacturing - Manufacturing facilities are sites where the primary activity is the conversion of raw materials or parts into finished products. Size and type of activity may vary from one site to another. In addition to actual production of goods, manufacturing facilities generally also have office, warehouse, research, and associated functions.

Mini-warehouse (Self-Storage) - A mini-warehouse is a building in which a storage unit or vault is rented for the storage of goods. Each unit is physically separated from other units and access is usually provided through an overhead door or other common access point.

Utilities - A utility is a free-standing building that can house office space, a storage area, and electromechanical or industrial equipment that support a local electrical, communication, water supply or control, or sewage treatment utility.

For land uses not specified within this category, the General Light Industrial land use shall serve as a default use. The City Engineer shall make the final determination for a specific use in calculating impact fees.

### ***Institutional***

Private School (K-12) – A private school (K-8) primarily serves students attending kindergarten through the eighth grade but may also include students beginning with pre-K classes. These schools

## APPENDICES

---

may also offer extended care and day care. Students may travel a long distance to get to private schools.

Junior/Community College - This land use includes two-year junior colleges or community colleges. A number of two-year institutions have sizable evening programs.

Church - A church is a building in which public worship services are held. A church houses an assembly hall or sanctuary; it may also house meeting rooms, classrooms, and, occasionally, dining, catering, or party facilities.

Day Care Center - A day care center is a facility where care for pre-school age children is provided, normally during the daytime hours. Day care facilities generally include classrooms, offices, eating areas, and playgrounds. Some centers also provide after-school care for older children including after school care.

### **Other**

Land Use not contained within Equivalency Table – This table contains typical land uses experienced within the city. Uses not specified herein should be discussed with the City Engineer. Data may be provided by an Applicant to consideration by the City Engineer. The City Engineer shall have the final determination in land use identification for impact fee purposes.

## Appendix D: Existing Capital Improvements

**EXISTING CAPITAL IMPROVEMENTS**

**Definitions**

LANES	The total number of lanes in both directions available for travel.
TYPE	The type of roadway (used in determining capacity):  DA = divided arterial UA = undivided arterial UC = undivided collector
PK-HR VOLUME	The existing volume of cars on the roadway segment traveling during the afternoon (P.M.) peak hour of travel. A and B indicate the two directions of travel. Direction A is a northbound or eastbound and direction B is southbound or westbound. If only one half of the roadway is located within the service area (see % in service area), the opposing direction will have no volume in the service area.
% IN SERVICE AREA	If the roadway is located on the boundary of the service area (with the city limits running along the centerline of the roadway), then half of the roadway is inventoried in the service area and the other half is not. This value is either 50% or 100%.
VEH-MI SUPPLY PK-HR	The number of total service units (vehicle-miles) supplied within the service area, based on the length, and established capacity of the roadway type.
VEH-MI TOTAL DEMAND PK-HR	The total service unit (vehicle-mile) demand created by existing traffic on the roadway segment in the afternoon peak hour.
EXCESS CAPACITY PK-HR VEH-MI	The number of service units supplied but unused by existing traffic in the afternoon peak hour.
EXISTING DEFICIENCIES PK-HR VEH-MI	The number of service units of demand in excess of the service units supplied.

NOTE: Excess capacity and existing deficiencies are calculated separately for each direction. It is possible to have excess capacity in one direction and an existing deficiency in the other. When both directions have excess capacity or deficiencies, the total for both directions are presented.

 DA - Divided Arterial  
 UA - Undivided Arterial  
 SA - Special Arterial with two-way left turn lane (TWLTL)  
 DC - Divided collector  
 UC - Undivided Collector  
 SC - Special Collector with two-way left turn lane (TWLTL)

## Appendix E: Roadway Improvement Plan Projects

**ROADWAY IMPROVEMENTS PLAN PROJECTS**

**Definitions**

LANES	The total number of lanes in both directions available for travel.
TYPE	The type of roadway (used in determining capacity):  DA = divided arterial    SA = special arterial (similar to DA)
PK-HR VOLUME	the existing volumes of cars on the roadway segment traveling during the afternoon (P.M.) peak hour of travel.
% IN SERVICE AREA	If the roadway is located on the boundary of the service area (with the city limits running along the centerline of the roadway), then half of the roadway is inventoried in the service area and the other half is not. This value is either 50% or 100%.
VEH-MI SUPPLY TOTAL	The number of total service units (vehicle-miles) supplied within the service area, based on the length, and established capacity of the roadway type.
VEH-MI TOTAL DEMAND PK-HR	The total service unit (vehicle-mile) demand created by existing traffic on the roadway segment in the afternoon peak hour.
EXCESS CAPACITY PK-HR VEH-MI	The number of service units supplied but unused by existing traffic in the afternoon peak hour.
FINANCE COST	Estimate of the cost of financing the cost of project development. Included for recoupment projects along John King Boulevard. Not applied for new recoupment and future projects added under this updated Impact Fee CIP
ROW	Estimated value of private owned right of way needed to be acquired for construction of the roadway improvements.

## Appendix F: Roadway Improvements Plan Cost Analysis

**ROADWAY IMPROVEMENTS PLAN COST ANALYSIS**

**Definitions**

LANES	The total number of lanes in both directions available for travel.
TYPE	The type of roadway (used in determining capacity):  DA = divided arterial    SA = special arterial
% IN SERVICE AREA	If the roadway is located on the boundary of the service area (with the city limits running along the centerline of the roadway), then half of the roadway is inventoried in the service area and the other half is not. This value is either 50% or 100%.
TOTAL SEGMENT COST	The estimated cost (in dollars) of the entire segment of the proposed improvement.
TOTAL COST IN SERVICE AREA	The estimated cost (in dollars) of the portion of the proposed roadway improvement within the service area.

**Waxahachie Roadway Impact Fee Study Update**  
**Full System Roadway CIP Costing**

# 1. PURPOSE

Chapter 395 of the Texas Local Government Code prescribes the process by which cities in Texas must formulate development impact fees. The initial process is the establishment of land use assumptions. These land use assumptions, which also include population and employment projections, will become the basis for the preparation of impact fee capital improvement plans for water, wastewater, and roadway facilities.

To assist the City of Waxahachie in determining the need and timing of capital improvements to serve future development, a reasonable estimation of future growth is required. The purpose of this report is to formulate growth and development projections based upon assumptions pertaining to the type, location, quantity and timing of various future land uses within the community, and to establish and document the methodology used for preparing the growth and land use assumptions.

## Land Use Assumptions Report Elements

This report contains the following components:

- I. **Methodology** – Explanation of the general methodology used to prepare the land use assumptions.
- II. **Data Collection Zones & Service Area Maps (Figures 1, 2 and 3)** – Explanation of data collection zones (traffic survey zones), and division of the City into impact fee service areas for roadway, water, and wastewater facilities.
- III. **Base Year Data** – Information on population, employment, and land use for Waxahachie as of 2020 for each capital facility service area.
- IV. **Ten-Year Growth Assumptions** – Population and employment growth assumptions for ten years by impact fee service area.
- V. **Ultimate Population Projection** – Projections that reflect a completely developed condition based upon the City's ultimate "build-out" scenario.
- VI. **Summary** – Brief synopsis of the land use assumptions report.

## 2. METHODOLOGY

Based on the growth assumptions and the capital improvements needed to support growth, it is possible to develop an impact fee structure that fairly allocates improvement costs to growth areas in relation to their impact on the entire infrastructure system. The database and projections in this report have been formulated using reasonable and generally accepted planning principles.

These land use assumptions and future growth projections take into consideration several factors influencing development patterns, including the following:

- The character, type, density, and quantity of existing development
- Existing zoning patterns
- Anticipated future land use (as shown on the City's Future Land Use Plan)
- Availability of land for future expansion
- Current and historical growth trends within the City
- Building permit activity trends
- Employment and population absorption rates
- Physical holding capacity of the City
- Known or anticipated development projects

Following is the general methodology used for the preparation of this report:

1. Update impact fee service areas as necessary for roadway, water, and wastewater facilities (see 3. Data Collection Zones & Service Area Maps).
2. Collect/determine benchmark data on population, employment, and land use as of 2020 (see 4. Base Year Data).
3. Project population and employment growth for ten years by impact fee service area (see 5. Ten-Year Growth Assumptions).
4. Project the ultimate population for a fully developed City (see 6. Ultimate Population Projection).

More detailed discussion for each of the above is contained within the respective sections.

## 3. DATA COLLECTION ZONES & SERVICE AREA MAPS

### Data Collection Zones

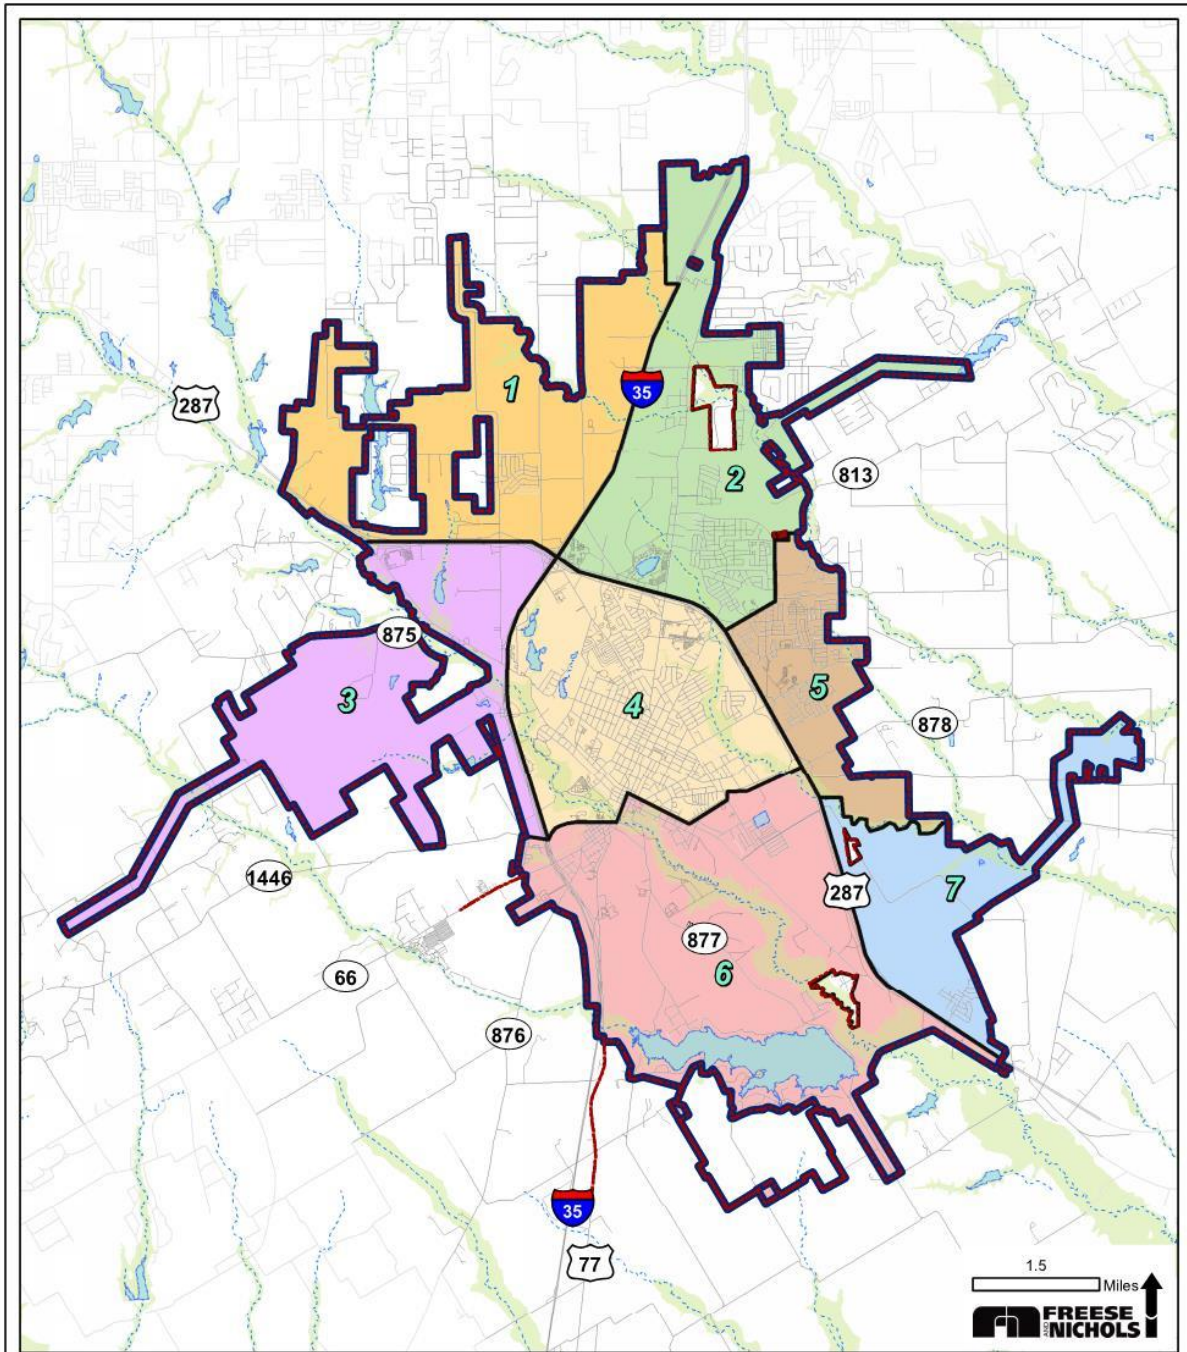

The data collection zones used for the land use assumptions are based on the 2020 demographic modeling structure from the North Central Texas Council of Governments (NCTCOG), composed of small geographic areas known as traffic survey zones (TSZs). A TSZ is a type of data collection zone that has been established by NCTCOG for all areas within the region, including areas within the corporate City limits of Waxahachie. Data sets in a TSZ include occupied households, the basis for the projections in this report. The TSZs within Waxahachie vary in size from about 50 acres to several hundred acres.

TSZs are formulated on the basis of homogeneity and traffic generation potential using major arterials, creeks, railroad lines and other physical boundaries for delineation. Since part of the data needed for the calculation of roadway impact fees is required to be compiled by TSZs, the land use assumptions are compiled by the same TSZs used by NCTCOG or combinations thereof. These TSZs are aggregated into different geographic boundaries to form service areas for roadway impact fees. The service area structure for roadway impact fees has remained unchanged since the 2015 impact fee update except for the inclusion of any annexed or de-annexed areas.

### Service Area Maps

**Figure 1**, entitled "Roadway Impact Fee Service Area Structure", details the seven service area structures for roadway facilities. All of the roadway service area boundaries encompass several TSZs and, in accordance with Chapter 395 of the Texas Local Government Code, are no more than six miles. Although the capital improvements plan and impact fees will be prepared as a separate document for roadway facilities, the geographic boundaries of the roadway service areas will be as shown on **Figure 1** for both documents. In addition, no changes have been made to the geographic boundaries of the roadway service areas since the last update of this report.

**Figure 2** and **Figure 3** show the service areas for water and wastewater facilities, respectively. The boundary for water facilities is the existing water service area as defined by the current Certificate of Convenience and Necessity (CCN). The boundary for the wastewater facilities is the general area of the City's extraterritorial jurisdiction. Documents containing the capital improvements plan for water and wastewater facilities will also be prepared separately.

## Data Format

The existing database, as well as the future projections, were formulated according to the following format and categories:

<b>Service Area</b>	Correlates to the proposed roadway, water and wastewater service areas identified in <b>Figures 1, 2 and 3</b> .
<b>Traffic Survey Zone (TSZ)</b>	Geographic areas established by the NCTCOG for modeling purposes, used for data collection purposes and termed TSZs within this report.
<b>Housing Units (2020)</b>	All housing units including single-family, duplex, multi-family and group quarters. The number of existing housing units has been shown for the base year (January 2020). Housing unit projections for the City limits were taken from NCTCOG's 2015 estimates and were projected by Freese and Nichols, Inc. (FNI) to 2020 using building permit data provided by the City. Housing unit projections relating to the Water and Wastewater service boundaries were derived from NCTCOG's 2018 projections, interpolated to January 2020.
<b>Housing Units (2030)</b>	Projected housing units by service zone for January 2030 (ten-year growth projections).
<b>Population (2020)</b>	Existing population for the base year (January 2020).
<b>Population (2030)</b>	Projected population by service zone for the year 2030 (ten-year growth projections).
<b>Employment (2020, 2030)</b>	<p>For this report, employment projections were taken from NCTCOG's 2018 estimates and interpolated by FNI to January 2020. Employment data is aggregated into three employment sectors by NCTCOG and include basic, retail and service. The following details which types of businesses fall within each of the three sectors:</p> <ul style="list-style-type: none"><li>• <u>Basic</u> – Land use activities that produce goods and services such as those that are exported outside the local economy; manufacturing, construction, transportation, wholesale trade, warehousing and other industrial uses.</li><li>• <u>Retail</u> – Land use activities that provide for the retail sale of goods that primarily serve households and whose location choice is oriented toward the household sector such as grocery stores, restaurants, etc.</li><li>• <u>Service</u> – Land use activities that provide personal and professional services such as financial, insurance, government, and other professional and administrative offices.</li></ul>

# 4. BASE YEAR DATA

This section documents the City’s historical growth trends and data to the base year of January 1, 2020. This “benchmark” information provided a starting basis of data for the ten-year growth assumptions that are presented within the following section.

## Population Growth

One method of predicting future growth is looking at past growth. Per the U.S. Census, the historical populations for Waxahachie from 1940 to 2020 are shown below:

YEAR	POPULATION
1940	8,655
1950	11,204
1960	12,749
1970	13,452
1980	14,624
1990	18,168
2000	21,426
2010	30,152
2020 <sup>(1)</sup>	39,221

Source: U.S. Census  
<sup>(1)</sup> Estimate by Freese and Nichols, Inc. (FNI)

The 2020 population estimate shown above was derived from NCTCOG’s 2015 estimate of 32,670 for the City of Waxahachie, projecting to 2020 using building permit data received from City Staff from January 2015 to January 2020. After occupied housing units had been projected using the building permit data, population projections were determined using a 2.72 persons per household multiplier.

## Existing Land Use

In any projection, a documentation of existing conditions is essential. Documentation of existing land use patterns and housing units was made from evaluating the City’s Comprehensive Plan and aerial imaging. For example, many TSZs were analyzed via aerial imaging to more accurately account for existing housing units – helping to mitigate potential duplication. These evaluations were then accounted for in the baseline for future growth projections.

**Table 1** presents a summary of existing population and employment for Waxahachie and its associated water and wastewater service areas. The appendices detail data by various impact fee service areas and further, by traffic survey zones.

<b>Table 1 EXISTING POPULATION &amp; EMPLOYMENT – 2020 BY ROADWAY, WATER AND WASTEWATER SERVICE AREAS</b>	
<b>Roadway Boundary – City Limits</b>	
Housing Units <sup>(1)</sup>	14,420

<sup>(2)</sup> FNI population estimates derived from building permit data and/or NCTCOG estimates from 2015/2018

<sup>(3)</sup> FNI employment estimates derived from NCTCOG projections from 2018

# 5. TEN-YEAR GROWTH ASSUMPTIONS

Growth is characterized in two forms: population (residential land use) and employment (nonresidential land use). A series of assumptions were made to arrive at reasonable growth rates for population and employment. The following assumptions have been made as a basis from which ten-year projections could be developed.

- Future land uses will occur as identified on the Future Land Use Plan,
- The City will be able to finance the necessary improvements to accommodate growth,
- School facilities will accommodate increases in enrollment, and
- Densities will be as projected in the Comprehensive Plan.

The ten-year projections, or land use assumptions, are based on the establishment of a reasonable growth rate that is based upon past trends or other considerations. Due to increased growth over the past decade in the Dallas/Fort Worth Metroplex, an analysis of annual growth based on data from building permit data and the U.S. Census was undertaken to provide further insight into growth trends experienced within the City.

The single-family building permit activity since 2015 in Waxahachie has fluctuated with time, ranging from 344 in 2015 to a high of 763 in 2019. Similarly, the annual growth rate for the City fluctuated dramatically from 2.6% in 2015 to 5.0% in 2019. **Table 2** presents this fluctuation in growth using single-family building permit data provided by the City. From the beginning of January 2015 to the end of December 2019, the City saw an average growth rate of 3.4%.

Table 2 Growth Projection – 2020						
Year	Total Pop. Jan. 1	Permits	Households Added	Pop. Increase <sup>(1)</sup>	Total Pop. Dec. 31	Compound Annual Growth Rate (CAGR)
2015	32,670	344	310	842	33,512	2.6%
2016	33,512	424	382	1,038	34,550	3.1%
2017	34,550	553	498	1,354	35,904	3.9%
2018	35,904	592	533	1,449	37,353	4.0%
2019	37,353	763	687	1,868	39,221	5.0%
<b>Total/CAGR (Start of 2015-End of 2019)</b>	--	2,676	2,408	6,551	--	3.4%

<sup>(1)</sup> Population increase based off persons per household (2.72)

U.S. Census data, projections from the 2016 Comprehensive Plan, and projections from the Texas Water Development Board (TWDB) reveals lower growth rates. Differences in growth rates from **Table 2** and **Table 3** may be attributed to both the Comprehensive Plan and TWDB not accounting for the significant growth the City has experienced in recent years.

<b>Table 3</b> Historical and Projected CAGR for Waxahachie, TX			
Years	U.S. Census	2016 Comprehensive Plan	TWDB
1970-1980	0.8%	--	--
1980-1990	2.2%	--	--
1990-2000	1.7%	--	--
2000-2010	3.3%	--	--
2010-2020	--	2.4%	2.4%
2020-2030	--	2.5%	1.3%
2030-2040	--	2.5%	2.0%
2040-2050	--	2.5%	2.1%
2050-2060	--	2.5%	2.0%

Sources: U.S. Census, 2016 Waxahachie Comprehensive Plan, Texas Water Development Board

Given these trends and an analysis of recommended growth rates from the 2016 Comprehensive Plan, a 3.5% annual growth rate was determined to be a reasonable rate at which Waxahachie could be expected to grow. This rate and associated data were reviewed and recommended by the Capital Improvements Advisory Committee (CIAC) in February 2020. As a point of reference, the previous land use assumption report for Waxahachie was based on a 2% growth rate.

The development of ten-year housing estimates was calculated using the 3.5% growth rate derived above. However, the growth was not projected to occur evenly throughout the roadway service areas of the City. The roadway service boundary, unlike the water and wastewater service boundaries, contains seven distinct service areas, making it important to determine population trends in each to determine where resources will be needed. While growth will generally occur throughout the city, the current City staff provided insight into the key growth areas within the community to help determine growth rate trends in each service area. The ten-year population estimates were determined by growing service areas to represent current development patterns while also generally maintaining the 3.5% overall growth rate. The household growth figures are shown by roadway service areas in **Table 4**.

Appendices A and B detail ten-year growth projections for population and employment by TSZ for roadway, water, and wastewater service areas. An average household size of 2.72 persons per household was used to project the population in 2030. **Table 6** and **Table 7** summarize ten-year population and employment projections for the City.

## 6. ULTIMATE POPULATION PROJECTION

An ultimate population projection was also calculated for the water and wastewater service boundaries based on the Future Land Use Plan from the 2016 Comprehensive Plan. This projection determines buildout, meaning all areas accounted for have been developed or redeveloped in conformance with the Future Land Use Plan and its corresponding Future Land Use categories. **Table 8** shows the total buildout population by residential category for the water service boundary – estimated to be roughly 130,000. **Table 9** shows the total buildout population by residential category for the wastewater service boundary – estimated to be roughly 409,000.

In comparison to the ultimate population projections from the 2013 Land Use Assumption Report, it is important to note that buildout projections from the 2013 report were based on the Future Land Use Plan from the 2007 Comprehensive Plan. Given that the previous study’s ultimate population projections were estimated at 164,291 for the water service area and 327,094 for the wastewater service area, it is evident that density increased in many areas of the City’s extraterritorial jurisdiction in the 2016 Future Land Use Plan.

## 7. SUMMARY

- The existing estimated population of Waxahachie is 39,221 persons, and the existing estimated employment is 31,820 jobs.
- An average annual growth rate of 3.5 percent was used to calculate the Waxahachie ten-year population growth projections for all service area boundaries.
- The ten-year (2030) growth projection of Waxahachie’s City limits is 55,326 persons, and the ten-year employment projection is 40,000 jobs.
- The ultimate population of Waxahachie’s combined City limits and extraterritorial jurisdiction is projected to be approximately 408,898 persons.

# APPENDICES

## Data Format for Appendices “A” and “B”

The land use assumptions database (Appendices “A” and “B”), as well as future projections, were formulated according to the following format and categories:

### Appendix "A" - Ten-Year Population Projections

<b>Roadway Service Area</b>	Correlates to the roadway service areas identified on <b>Figure 1</b> .
<b>2020 Households</b>	Households represent all occupied dwelling units in 2020.
<b>2020 Population</b>	The 2020 calculated population for each TSZ.
<b>2030 Households</b>	Occupied dwelling units per TSZ in 2030.
<b>2030 Population</b>	The 2030 projected population tabulated for each TSZ and roadway service area.
<b>Traffic Survey Zone (TSZ)</b>	Traffic survey zones previously established by the NCTCOG for data collection purposes and termed TSZs in this report.

### Appendix "B" - Ten-Year Employment Projections

<b>Roadway Service Area</b>	Correlates to the roadway service areas identified on <b>Figure 1</b> .
<b>Employment</b>	Three classifications were used for employment and compiled for each roadway service area: <ul style="list-style-type: none"><li>• <u>Basic</u> – Land use activities that produce goods and services such as those that are exported outside the local economy: manufacturing, construction, transportation, wholesale trade, warehousing and other industrial uses.</li><li>• <u>Retail</u> – Land use activities that provide for the retail sale of goods that primarily serve households and whose location choice is oriented toward the household sector such as grocery stores, restaurants, etc.</li></ul>

- Service – Land use activities that provide personal and professional services such as financial, insurance, government, and other professional and administrative offices.

**Total Employment**

The total of the Basic, Retail, and Service employment categories.

## Appendix I: Roadway Unit Cost Estimates by Functional Classification

## Type A - Major Thoroughfare

Estimate Per Linear Foot					
Description	Unit	Quantity Formula	Quantity	Unit Price	Cost
General					
Mobilization and Contingency (15.5% of Total Cost)	LS	N/A	1	\$153.91	\$153.91
Paving					
Preparing Right of Way (2.8% of Total Cost)	STA	N/A	0.01	\$1,500.00	\$15.00
Remove Existing Pavement	STA	N/A	0.01	\$1,000.00	\$10.00
Unclassified Street Excavation	CY	$(ROW * 2.5 * 1) / 27$	11.10	\$10.00	\$111.00
8" Lime Stabilized Subgrade	SY	$(PVw + 4) / 9$	8.40	\$4.00	\$34.00
Lime for Stabilization	Ton	$((PVw + 4) / 9) * (35 / 2000)$	0.15	\$170.00	\$25.00
8" Reinforced Concrete Pavement (Class C)	SY	$(Lw * \# \text{ of Lanes}) / 9$	8.00	\$45.00	\$360.00
6" Concrete Monolithic Curb	LF	$1 + 1 + 1 + 1$	4.00	\$20.00	\$80.00
4" Reinforced Concrete Sidewalk	SY	$(2 * 6) / 9$	1.33	\$50.00	\$67.00
Grass Seeding by Hydromulching	SF	$ROW - PVw - Mw - SWw$	19.00	\$1.00	\$19.00
4" Median Pavement (Class A)	SY	$Mw / 9$	1.78	\$11.00	\$20.00
Non-Paving Costs					
Pavement Marking & Signage (2% of Paving Cost)	LS	N/A	1	\$14.82	\$14.82
Traffic Control (4% of Paving Cost)	LS	N/A	1	\$29.64	\$29.64
Erosion Control (3% of Paving Cost)	LS	N/A	1	\$22.23	\$22.23
Drainage Improvements (20% of Paving Cost)	LS	N/A	1	\$148.20	\$148.20
Utility Adjustment (5% of Paving Cost)	LS	N/A	1	\$37.05	\$37.05
				<b>Total =</b>	<b>\$1,146.85</b>

PVw = pavement width  
 Lw = lane width  
 Mw = median width  
 SWw = sidewalk width

## Type B - Major Thoroughfare

Estimate Per Linear Foot					
Description	Unit	Quantity Formula	Quantity	Unit Price	Cost
General					
Mobilization and Contingency (15.5% of Total Cost)	LS	N/A	1	\$124.83	\$124.83
Paving					
Preparing Right of Way (2.8% of Total Cost)	STA	N/A	0.01	\$1,500.00	\$15.00
Remove Existing Pavement	STA	N/A	0.01	\$1,000.00	\$10.00
Unclassified Street Excavation	CY	$(ROW * 2.5 * 1) / 27$	10.20	\$10.00	\$102.00
8" Lime Stabilized Subgrade	SY	$(PVw + 4) / 9$	7.80	\$4.00	\$31.00
Lime for Stabilization	Ton	$((PVw + 4) / 9) * (35 / 2000)$	0.14	\$170.00	\$23.00
8" Reinforced Concrete Pavement (Class C)	SY	$(Lw * \# \text{ of Lanes}) / 9$	5.33	\$45.00	\$240.00
6" Concrete Monolithic Curb	LF	1+1+1+1	4.00	\$20.00	\$80.00
4" Reinforced Concrete Sidewalk	SY	$(2 * 6) / 9$	1.33	\$50.00	\$67.00
Grass Seeding by Hydromulching	SF	$ROW - PVw - Mw - SWw$	16.00	\$1.00	\$16.00
4" Median Pavement (Class A)	SY	$Mw / 9$	1.56	\$11.00	\$17.00
Non-Paving Costs					
Pavement Marking & Signage (2% of Paving Cost)	LS	N/A	1	\$12.02	\$12.02
Traffic Control (4% of Paving Cost)	LS	N/A	1	\$24.04	\$24.04
Erosion Control (3% of Paving Cost)	LS	N/A	1	\$18.03	\$18.03
Drainage Improvements (20% of Paving Cost)	LS	N/A	1	\$120.20	\$120.20
Utility Adjustment (5% of Paving Cost)	LS	N/A	1	\$30.05	\$30.05
				<b>Total =</b>	<b>\$930.17</b>

PVw = pavement width  
 Lw = lane width  
 Mw = median width  
 SWw = sidewalk width

## Type C - Major Thoroughfare

Estimate Per Linear Foot					
Description	Unit	Quantity Formula	Quantity	Unit Price	Cost
General
